Young Women's Labour-Market Inclusion

Preliminary findings, Ukraine

Hernando Grueso, PhD · UNICEF

2026-11-01

Content

1 · NEET among young women aged 18–24 and the gap with young men

2 · Who is most affected: poverty, motherhood, displacement and care

3 · Education, vocational training, earnings and job quality

4 · The cost of young women remaining NEET: scenarios

5 · Investment options: what returns, for whom, at what cost

6 · Recommendations by GenU priority

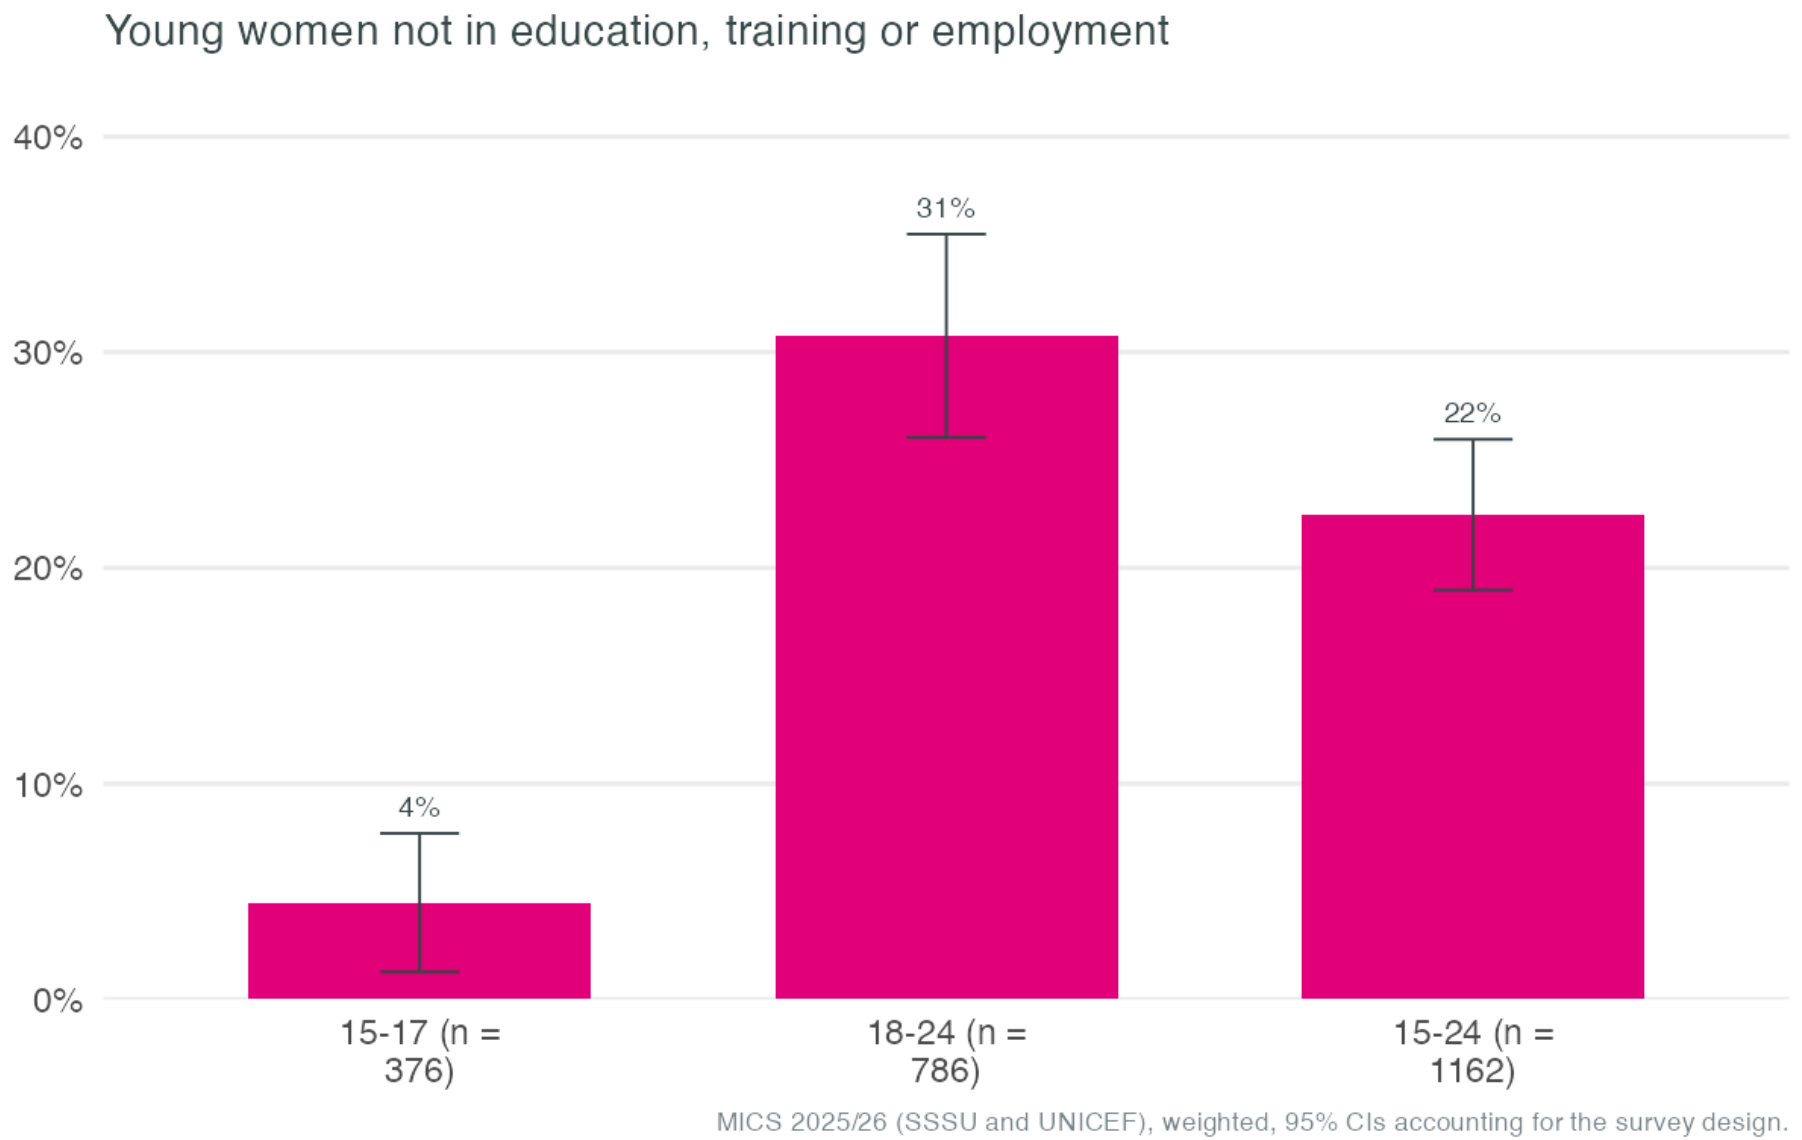

Appendix

Data sources

- **Multiple Indicator Cluster Survey (MICS) 2025/26**, State Statistics Service of Ukraine with UNICEF: 23,708 households, 37,315 household members, 8,213 women aged 15–49 selected for interview, and children 5–17. There is no men's questionnaire. Main source for education, NEET and employment among young women, marriage, motherhood, disability, displacement, wealth and changes in households since the beginning of the conflict.
- **UNICEF Household Social and Economic Status Survey (HSESS)**, December 2023 to February 2024, Institute of Demography and Quality of Life Problems: 18,838 individuals in 8,024 households, all regions covered by the survey (Luhansk oblast is not included). Covers women and men: participation, employment, NEET, job quality, occupations, earnings and childcare.
- **SSSU Labour Force Survey 2021** (anonymised public-use file), collected in 2021: 265.6k interviews from 151.7k persons aged 15+. Shown for reference only.

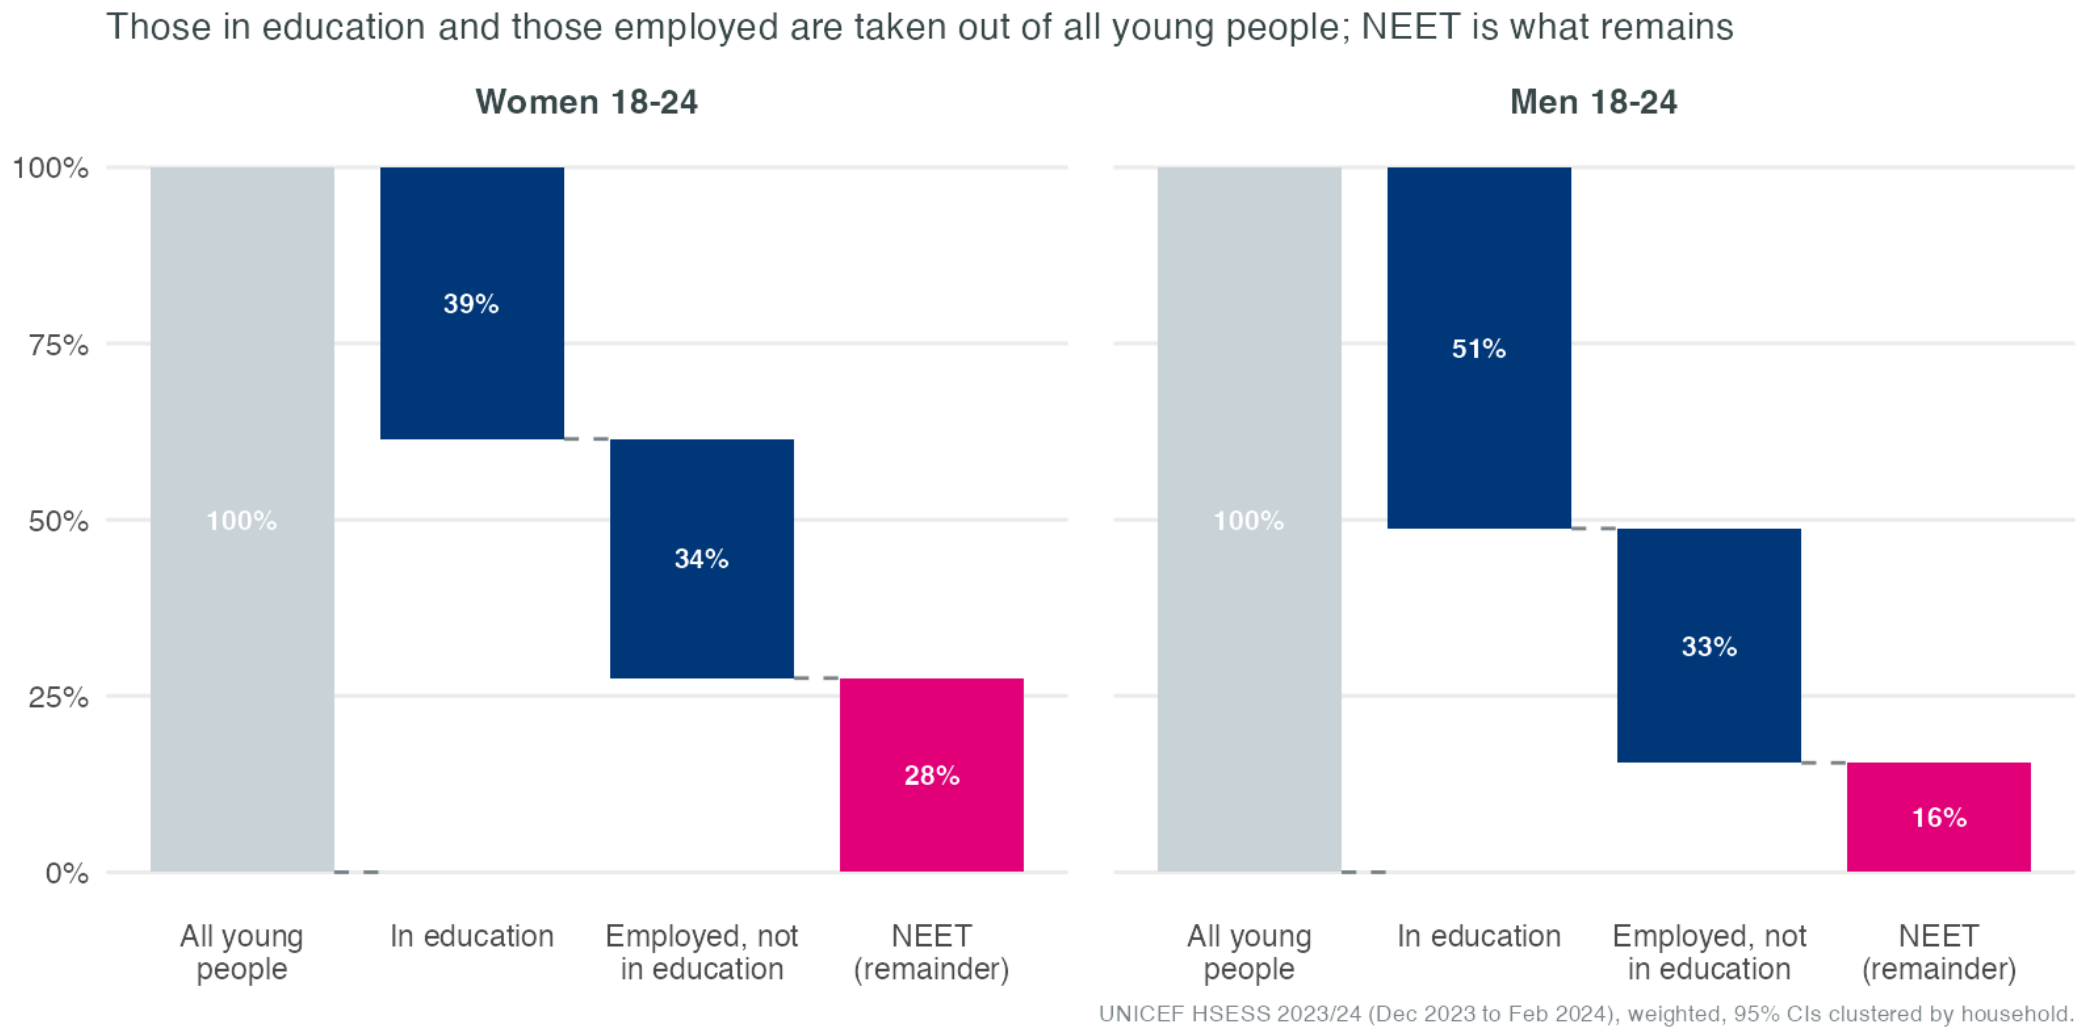

1 · NEET among young women and the gap with young men

NEET among young women: 4% at ages 15–17 and 31% at ages 18–24

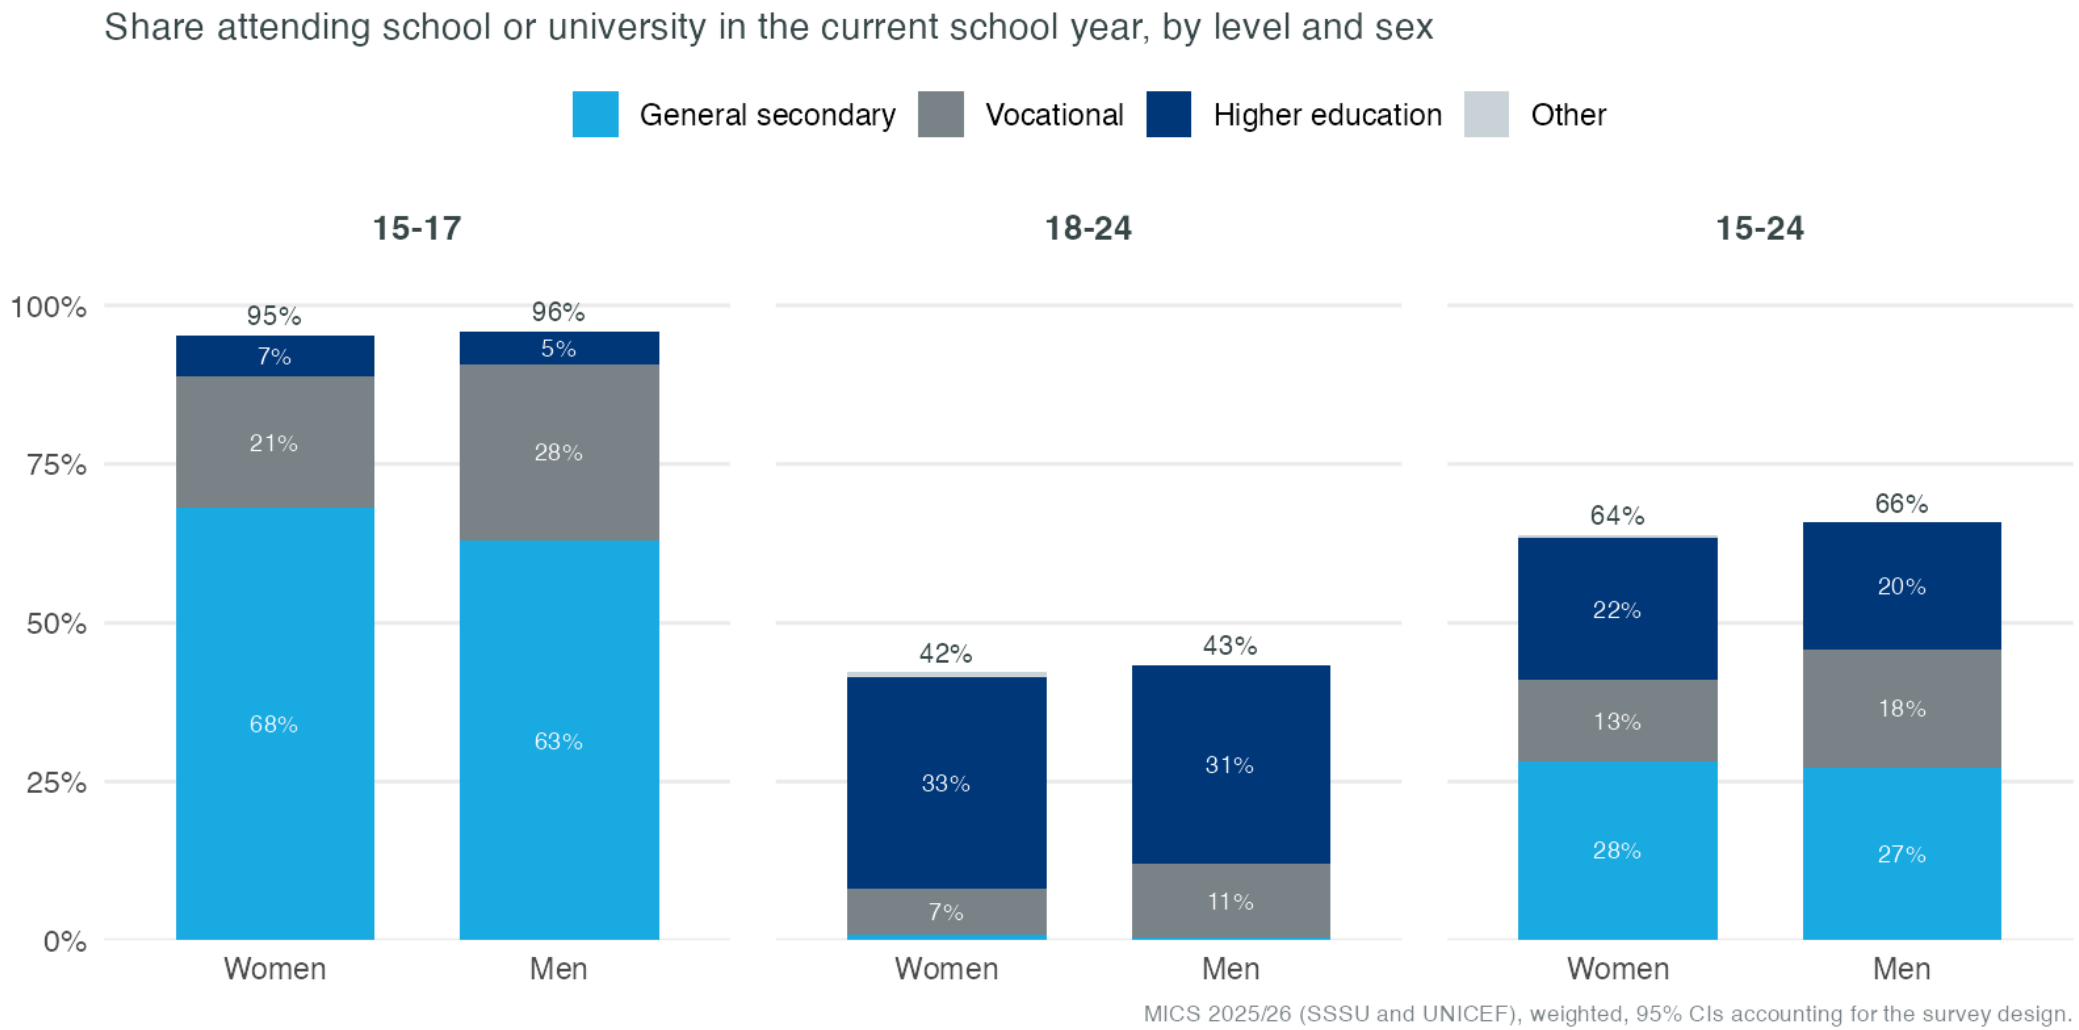

MICS 2025/26. NEET: not in education or training and not employed. The NEET questions are asked to women aged 15–24 only, so the men's rate comes from HSESS on the next slide. Ages 15–17 are mostly in education; 18–24 is the group where exclusion from both education and work concentrates.

At 18–24, women's higher NEET rate coincides with lower education participation, while employment outside education is similar

HSESS 2023/24. NEET: women 28%, men 16%. In education: women 38%, men 51%. Employed and not in education: women 34%, men 33%. The chart takes those in education and those employed out of all young people aged 18–24; NEET is the remainder.

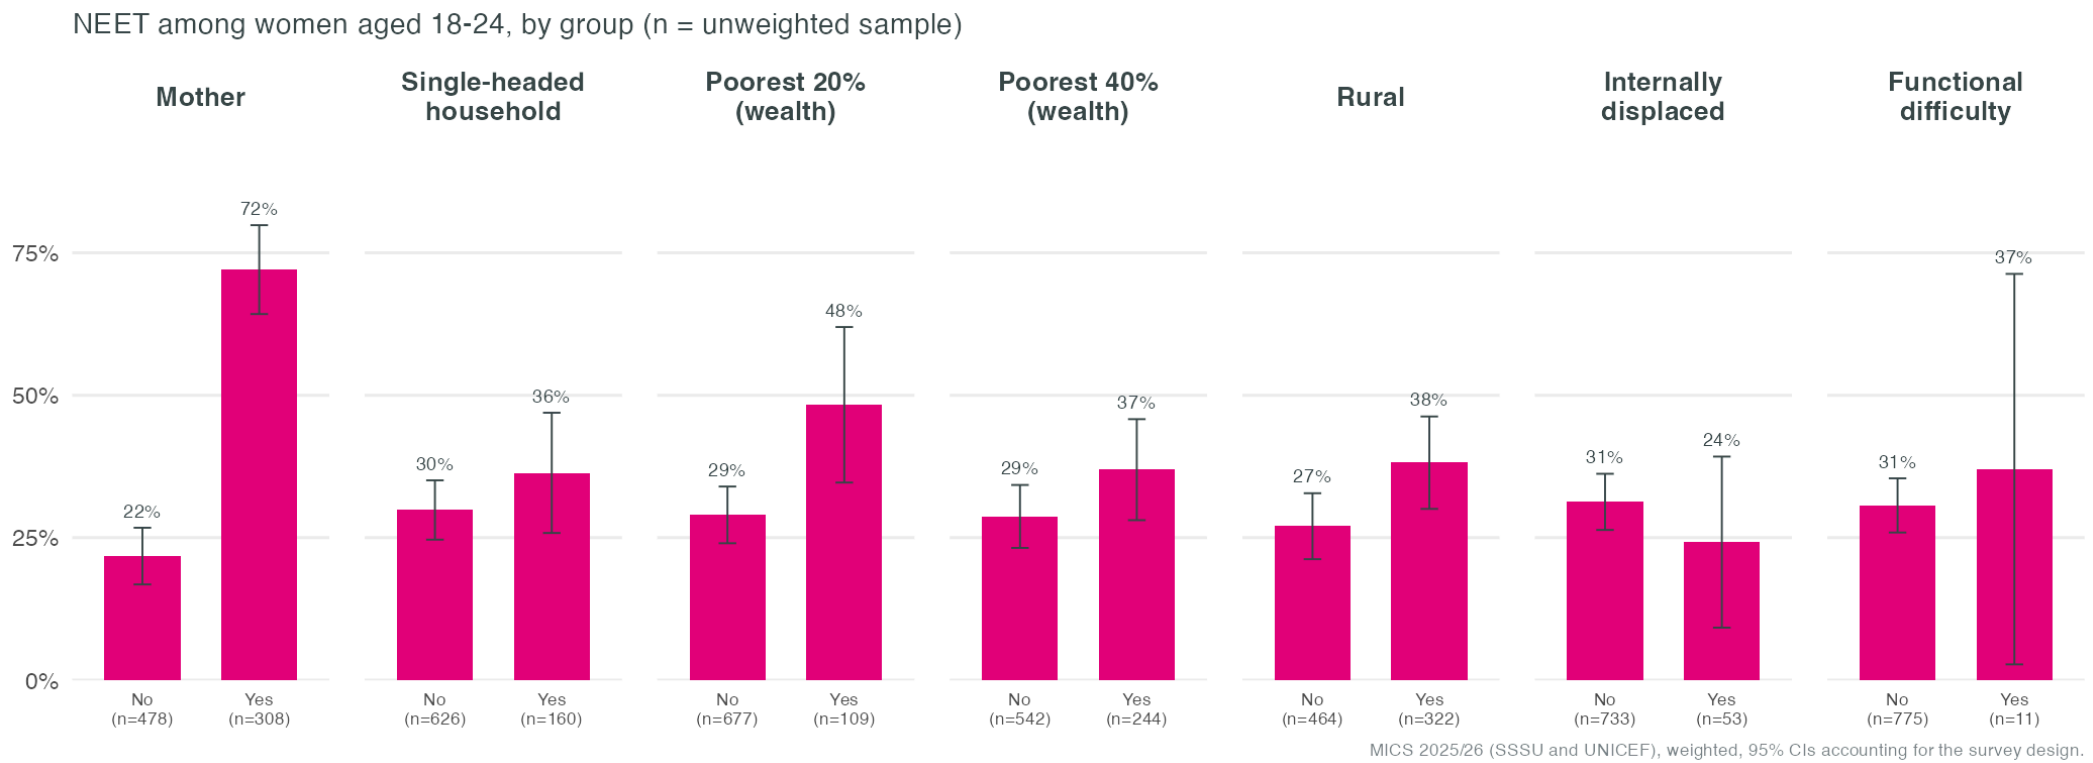

Attending school or university at 15–24: 64% of women and 66% of men

MICS 2025/26, household members attending in the current school year, by level. Higher education at 18–24: women 33%, men 31%. HSESS (previous slide) shows lower education participation among young women at 18–24; MICS does not show the same gap in higher-education attendance. The surveys differ in date (2023/24 vs 2025/26), coverage, respondent (self-report vs household respondent) and definition (currently receiving education vs attended in the current school year), so the two findings need reconciling before either is used on its own.

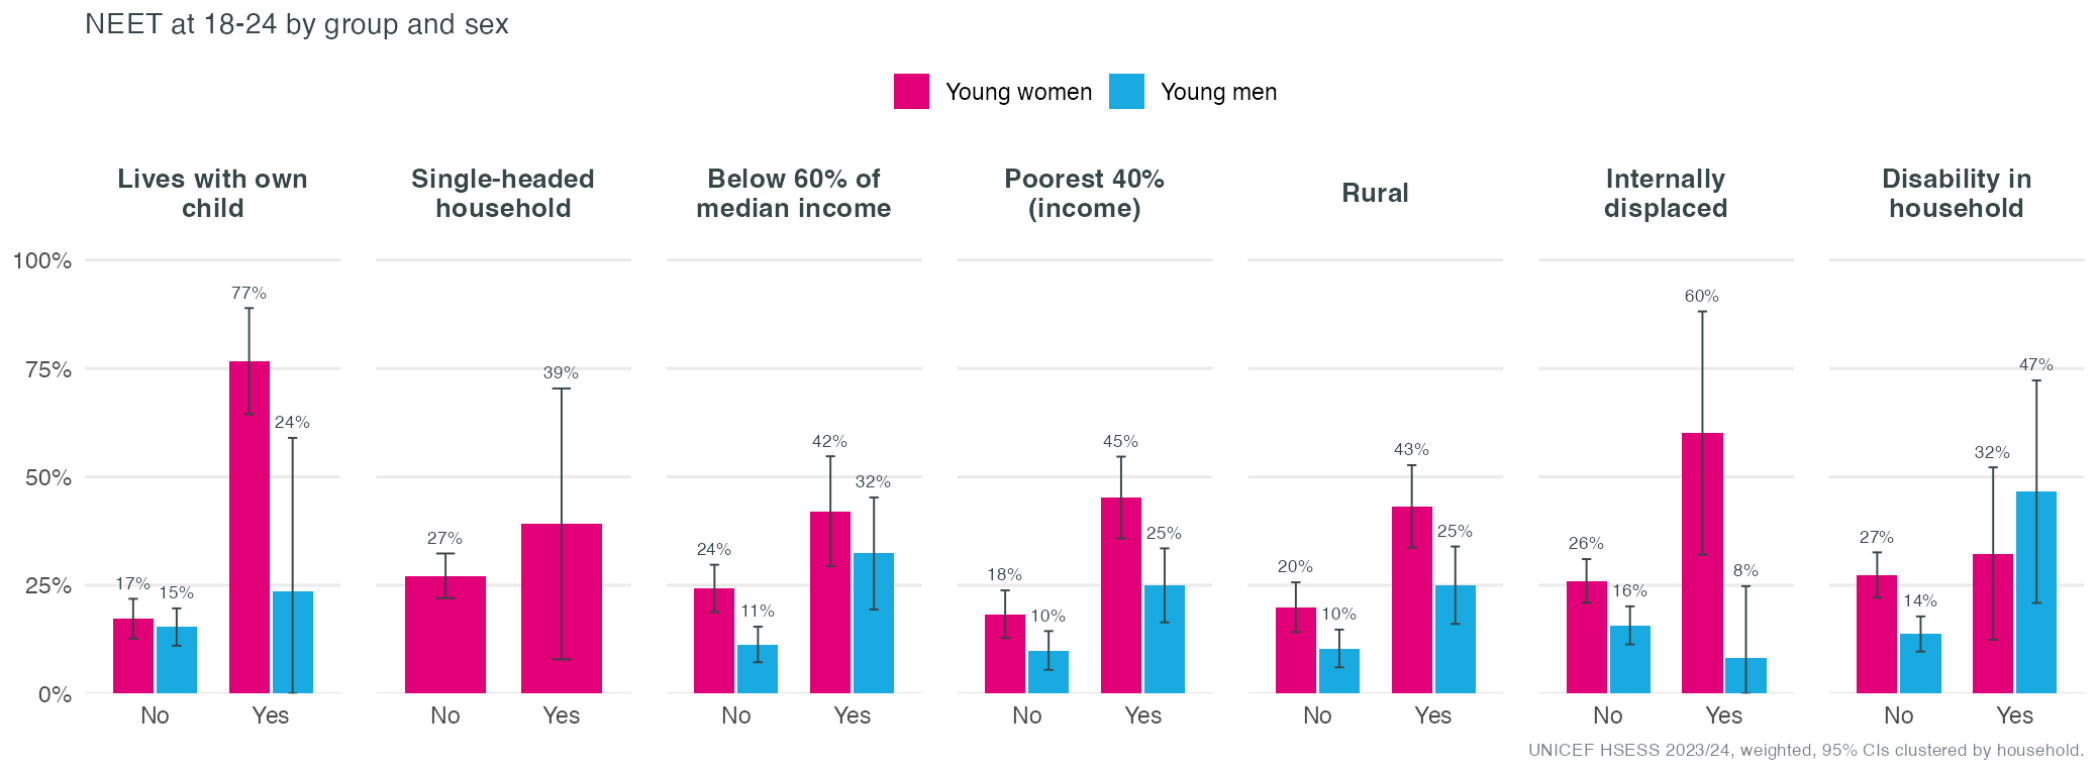

2 · Who is most affected?

NEET among women 18–24: 72% of mothers vs 22% of others; 48% in the poorest fifth vs 29%

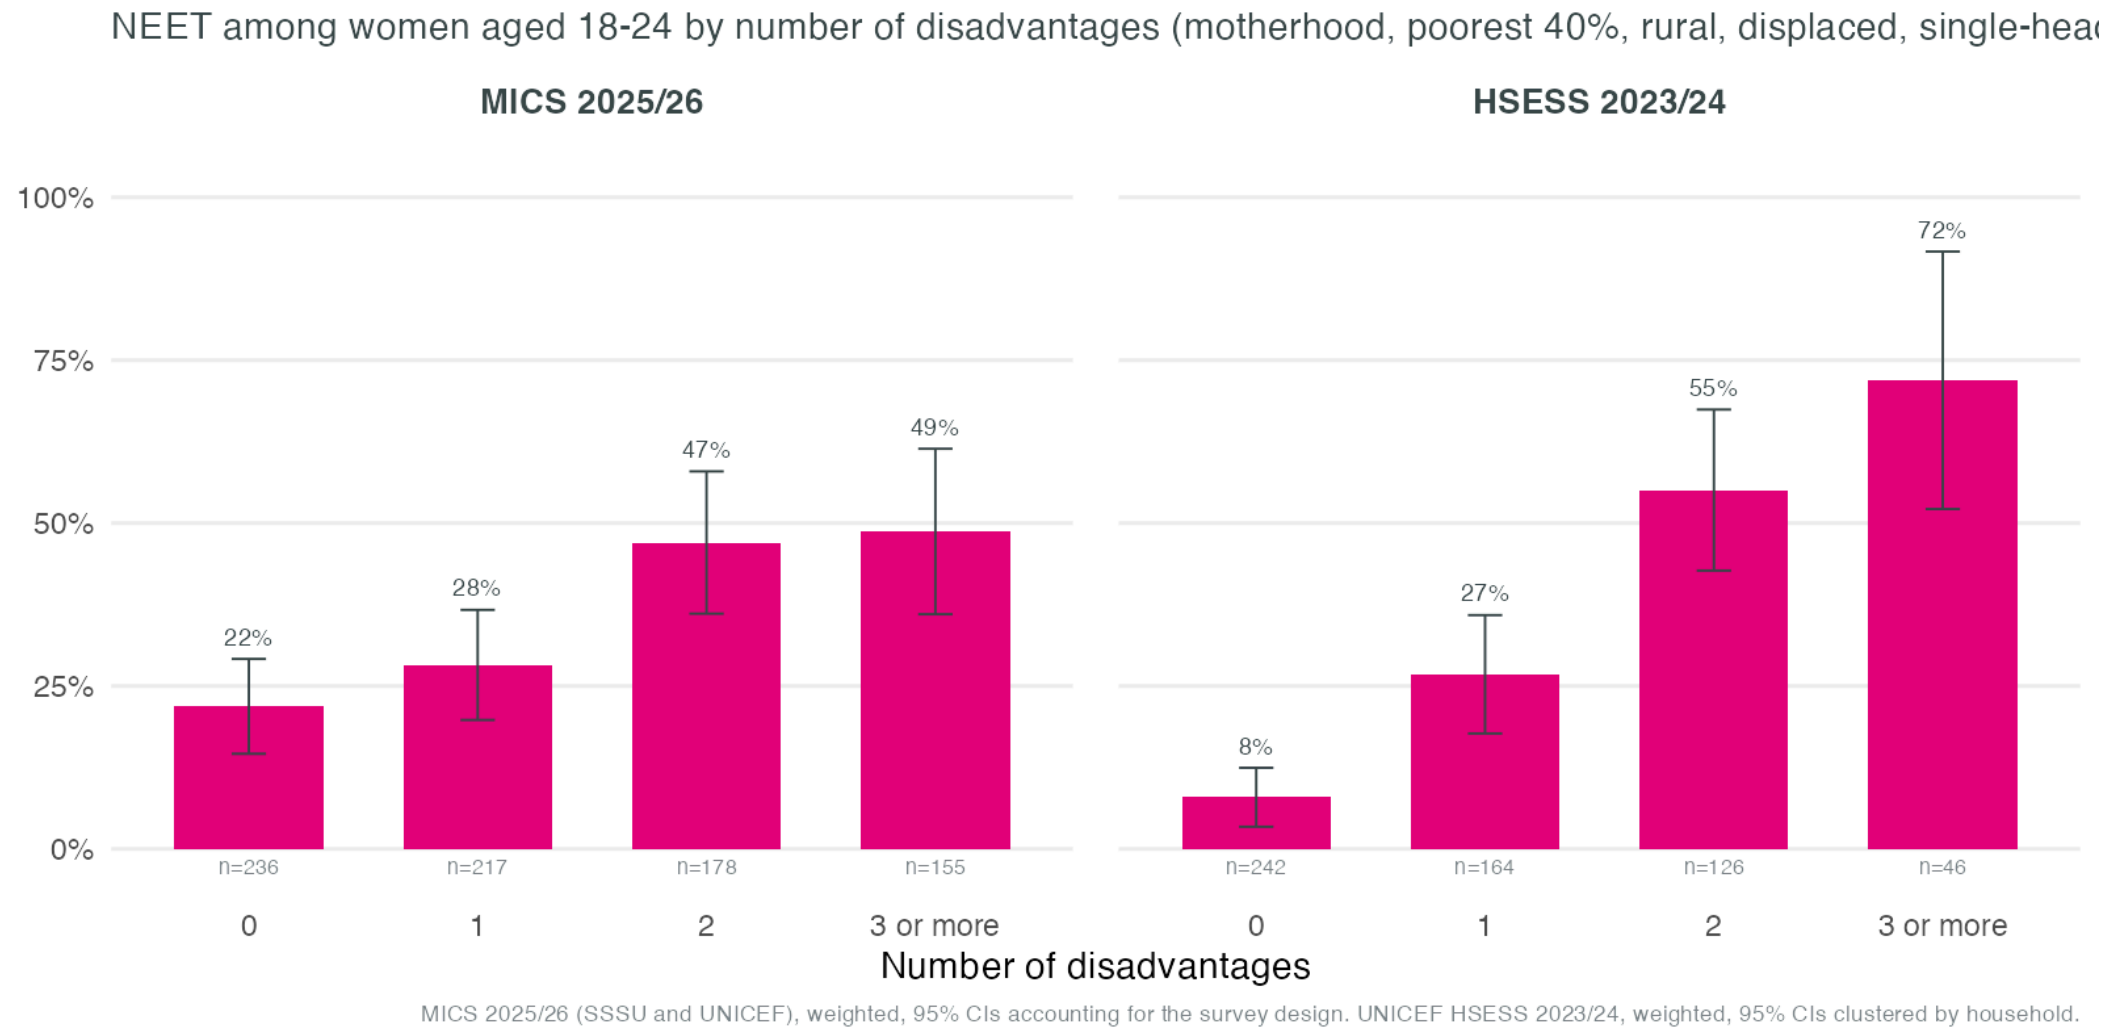

MICS 2025/26, women aged 18–24. Groups: mothers (children ever born), single-headed households (head without spouse in the roster, with children), wealth quintiles, rural, internally displaced, functional difficulty (Washington Group). Weighted rates with 95% confidence intervals and the unweighted n; small groups should not be ranked.

HSESS: among women 18–24 below 60% of median income, NEET is 42% against 24%; in single-headed households 39% against 27%

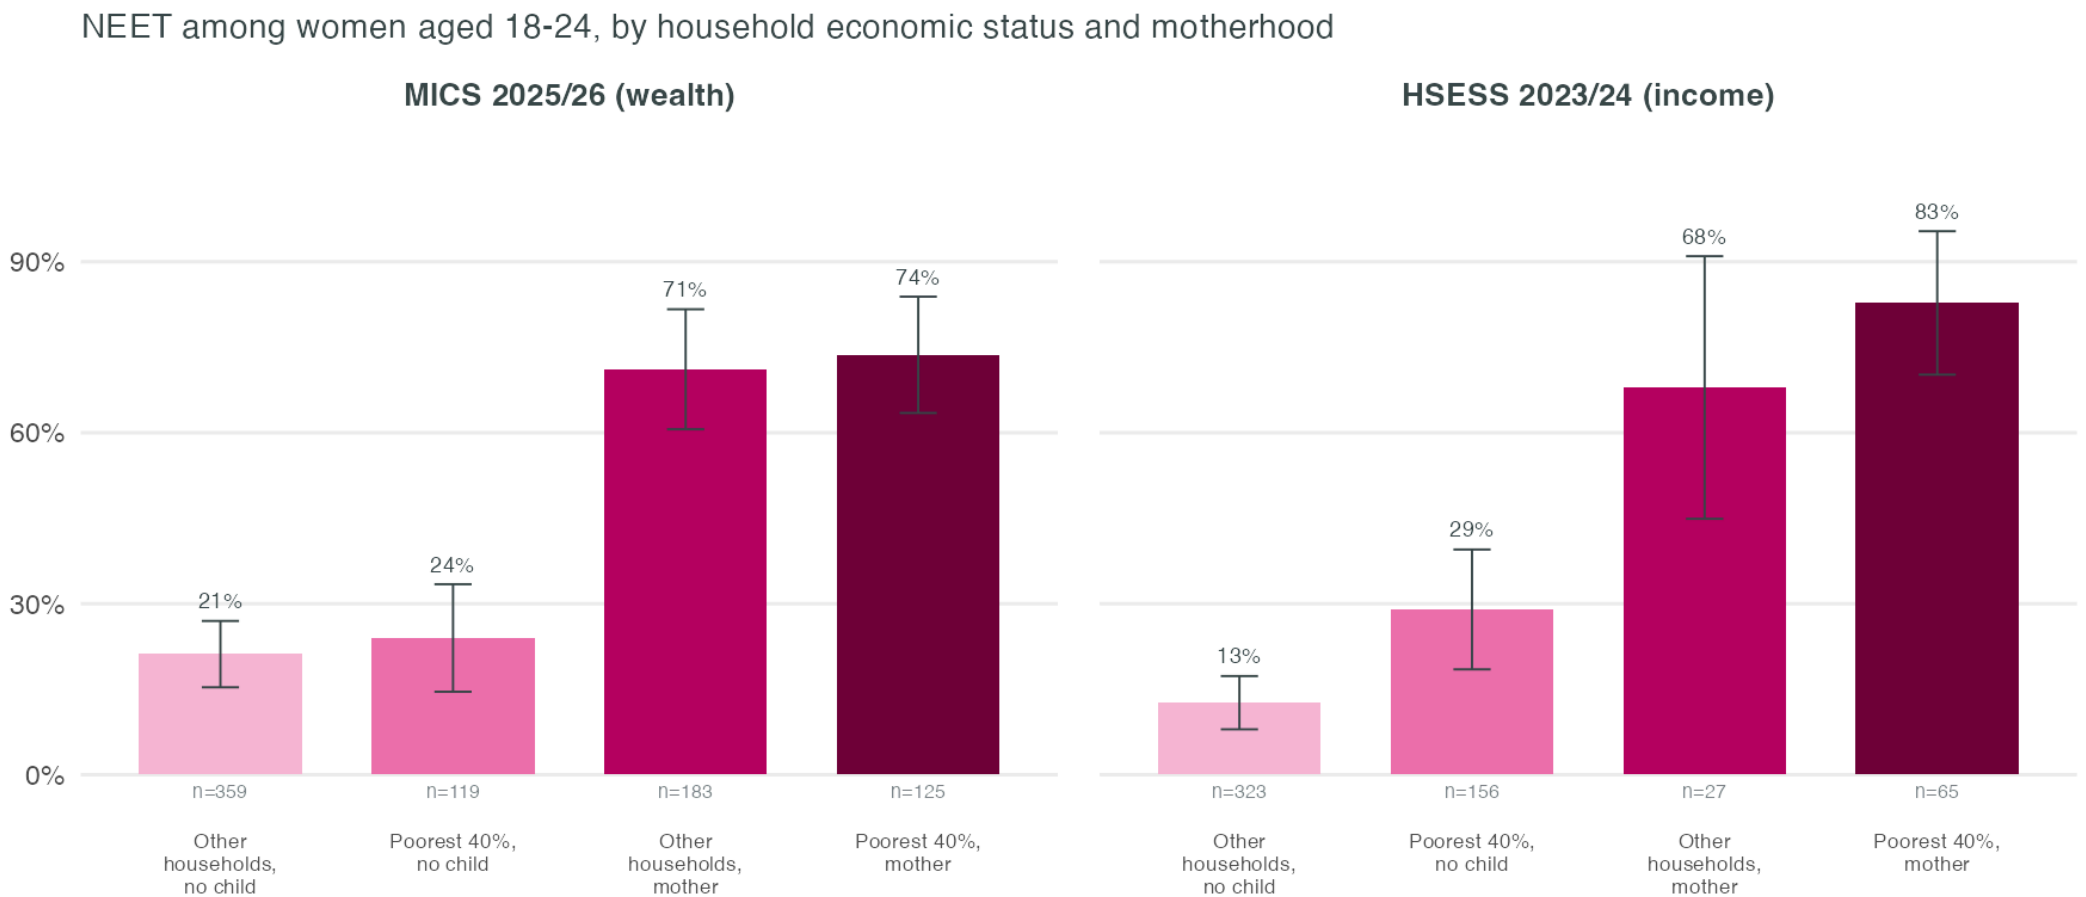

HSESS 2023/24, ages 18–24, women and men. Below 60% of median income: household income per member below 60% of the national median (relative poverty). Single-headed household: one adult living with children. Displacement is not consistently associated with higher NEET in either survey.

Disadvantages add up: NEET rises from 22% to 49% (MICS) and from 8% to 72% (HSESS) with three or more

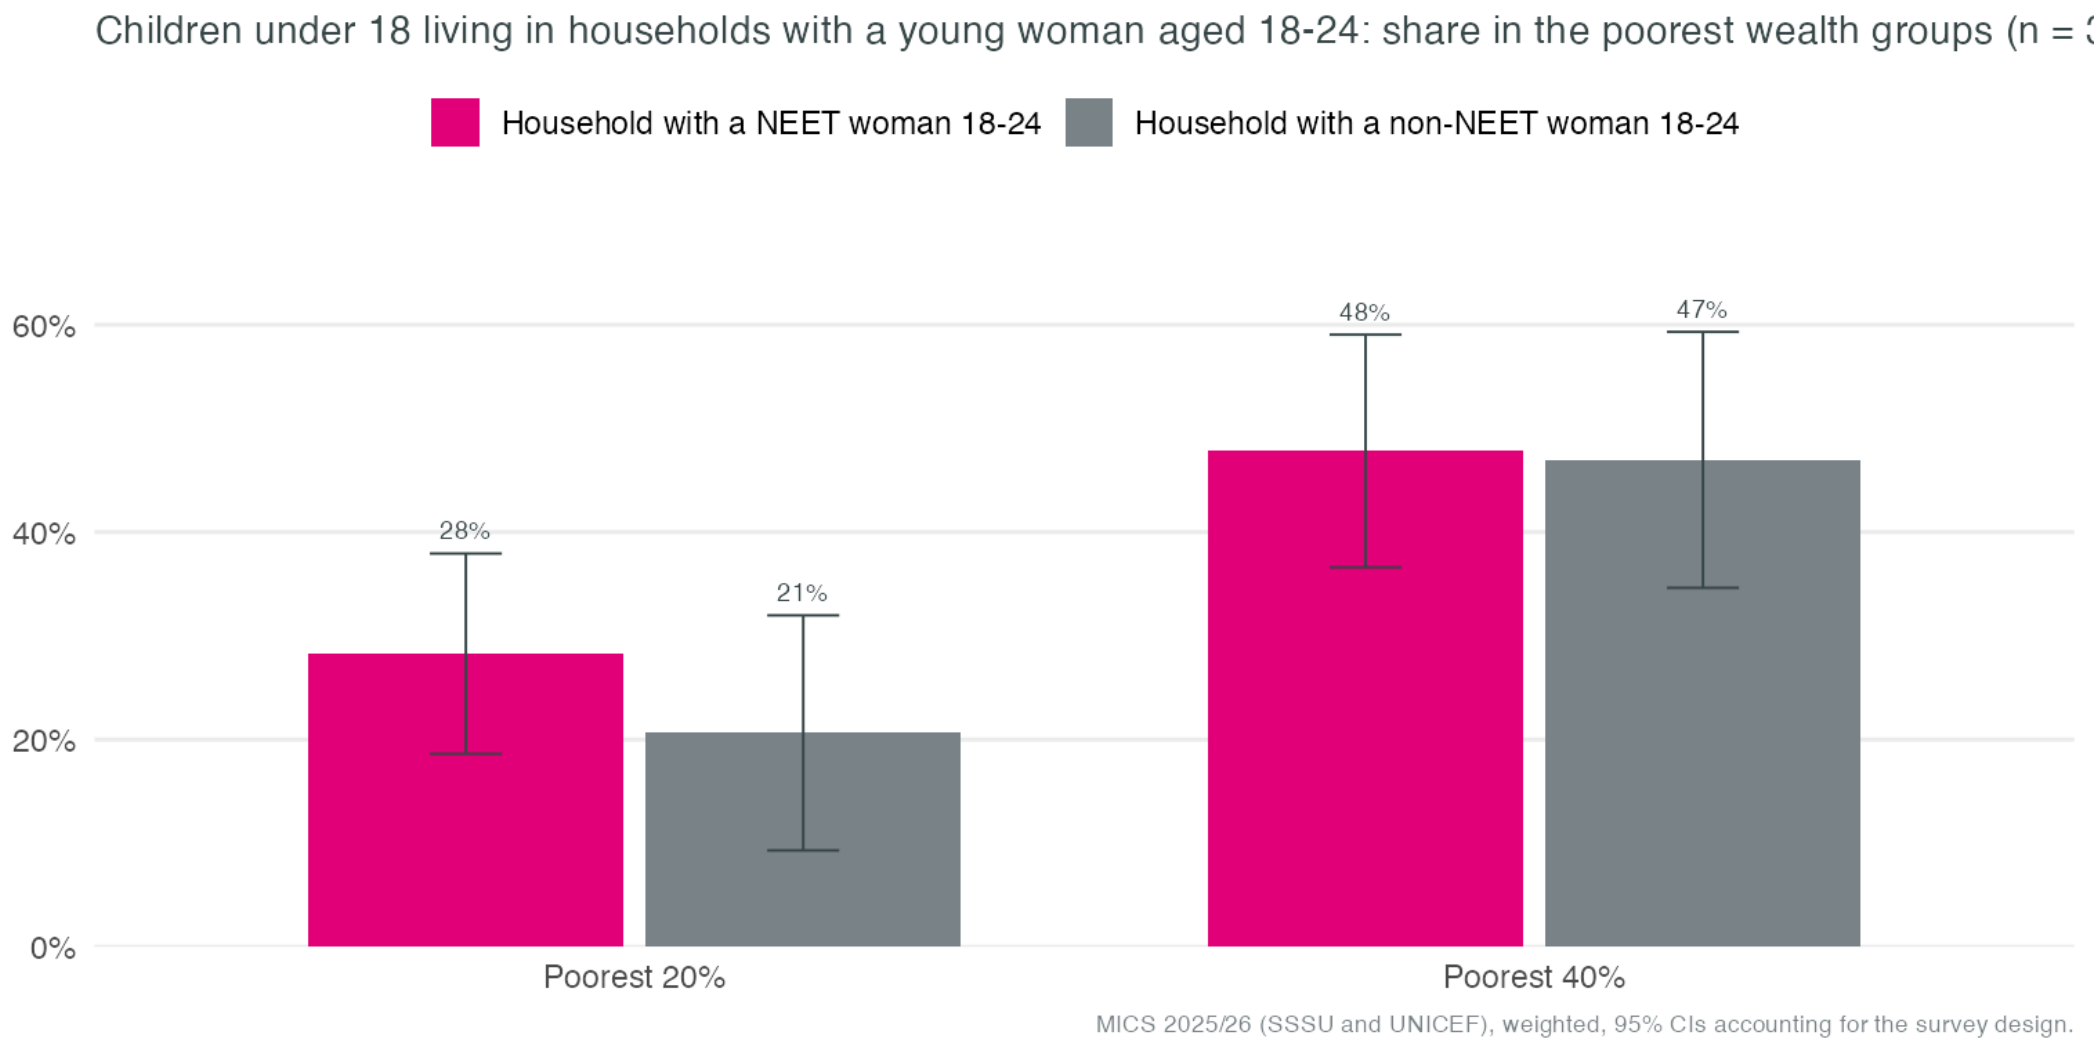

Women aged 18–24. Disadvantages counted: motherhood, poorest 40%, rural residence, internal displacement, single-headed household. Groups with few women have wide intervals.

Poverty and motherhood together: NEET is 74% among poor mothers (MICS) and 83% (HSESS), against 21% and 13% for women with neither

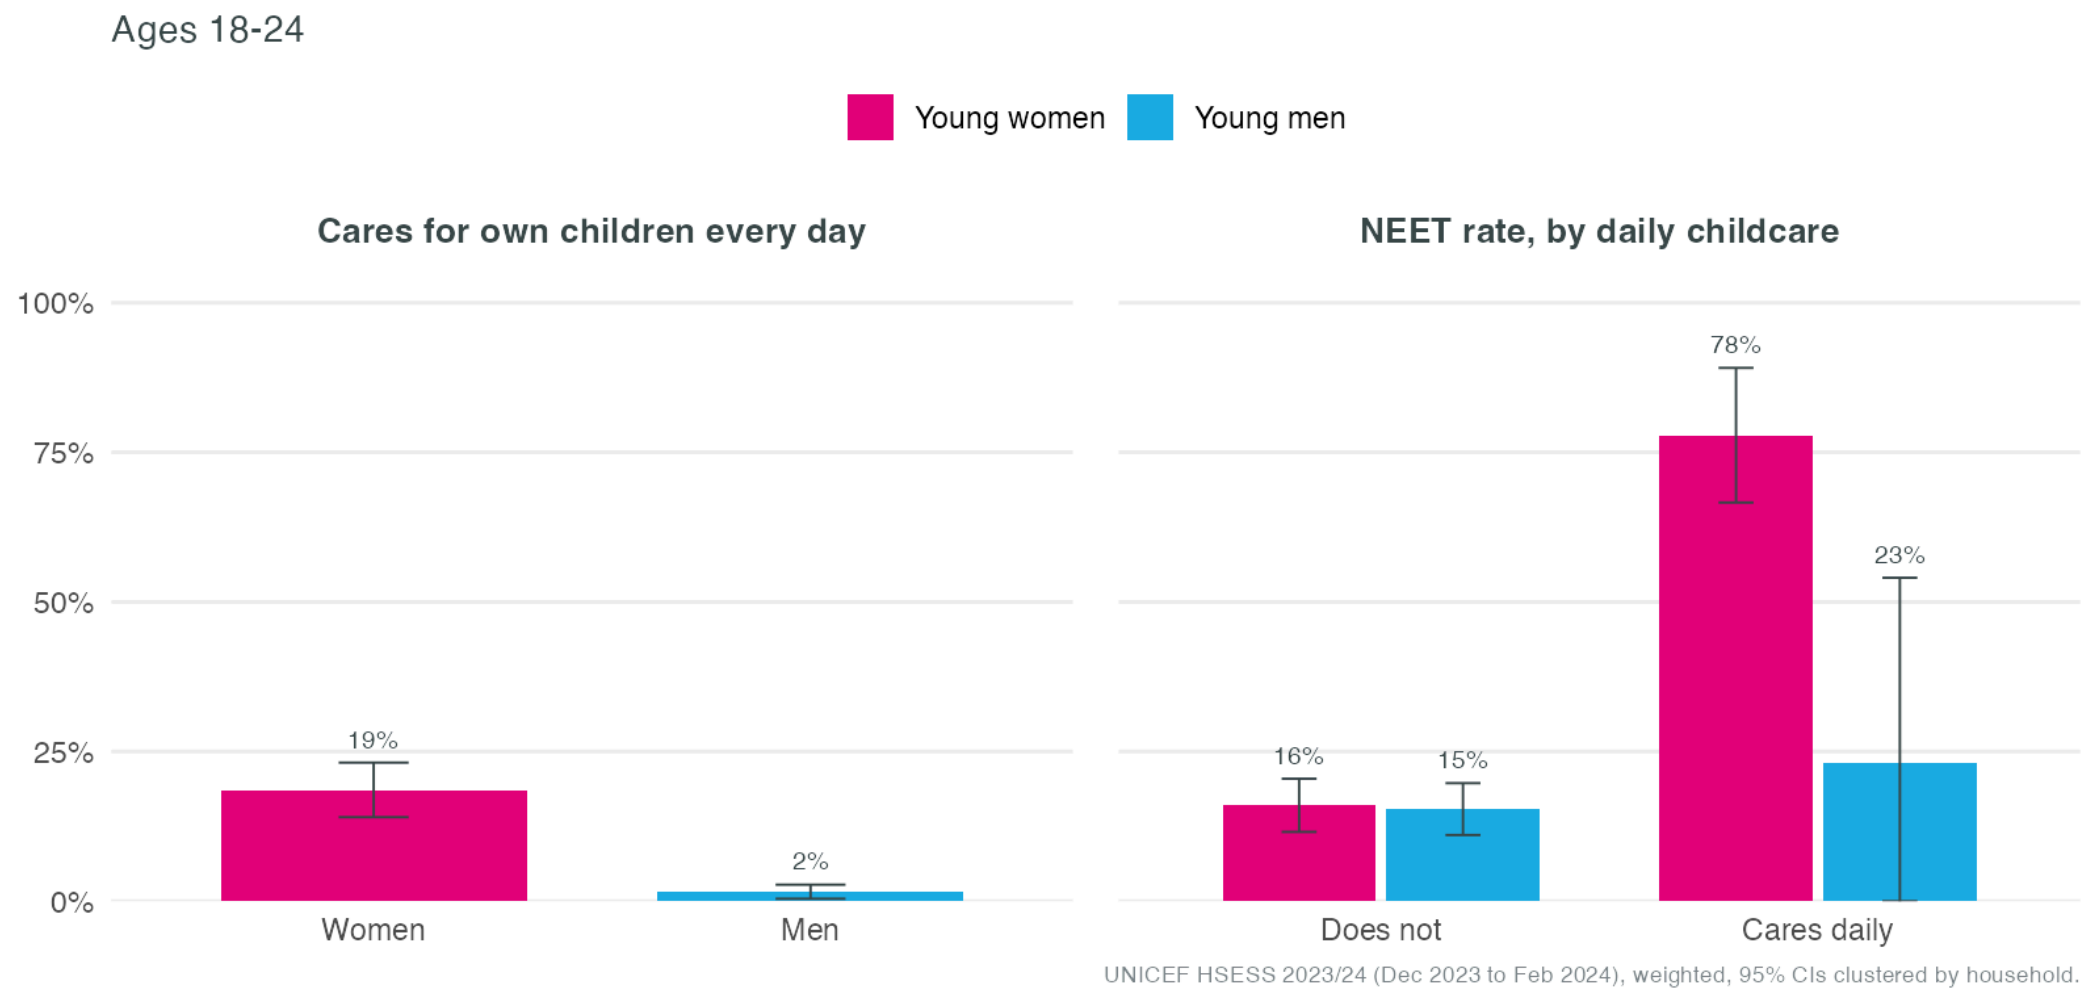

Women aged 18–24. Poor mothers make up 16% of all NEET young women in MICS and 30% in HSESS. Economic status: poorest 40% by wealth (MICS) or by income per member (HSESS).

Child poverty: 48% of children living with a NEET young woman are in the poorest 40% of households, against 47% where she is not NEET

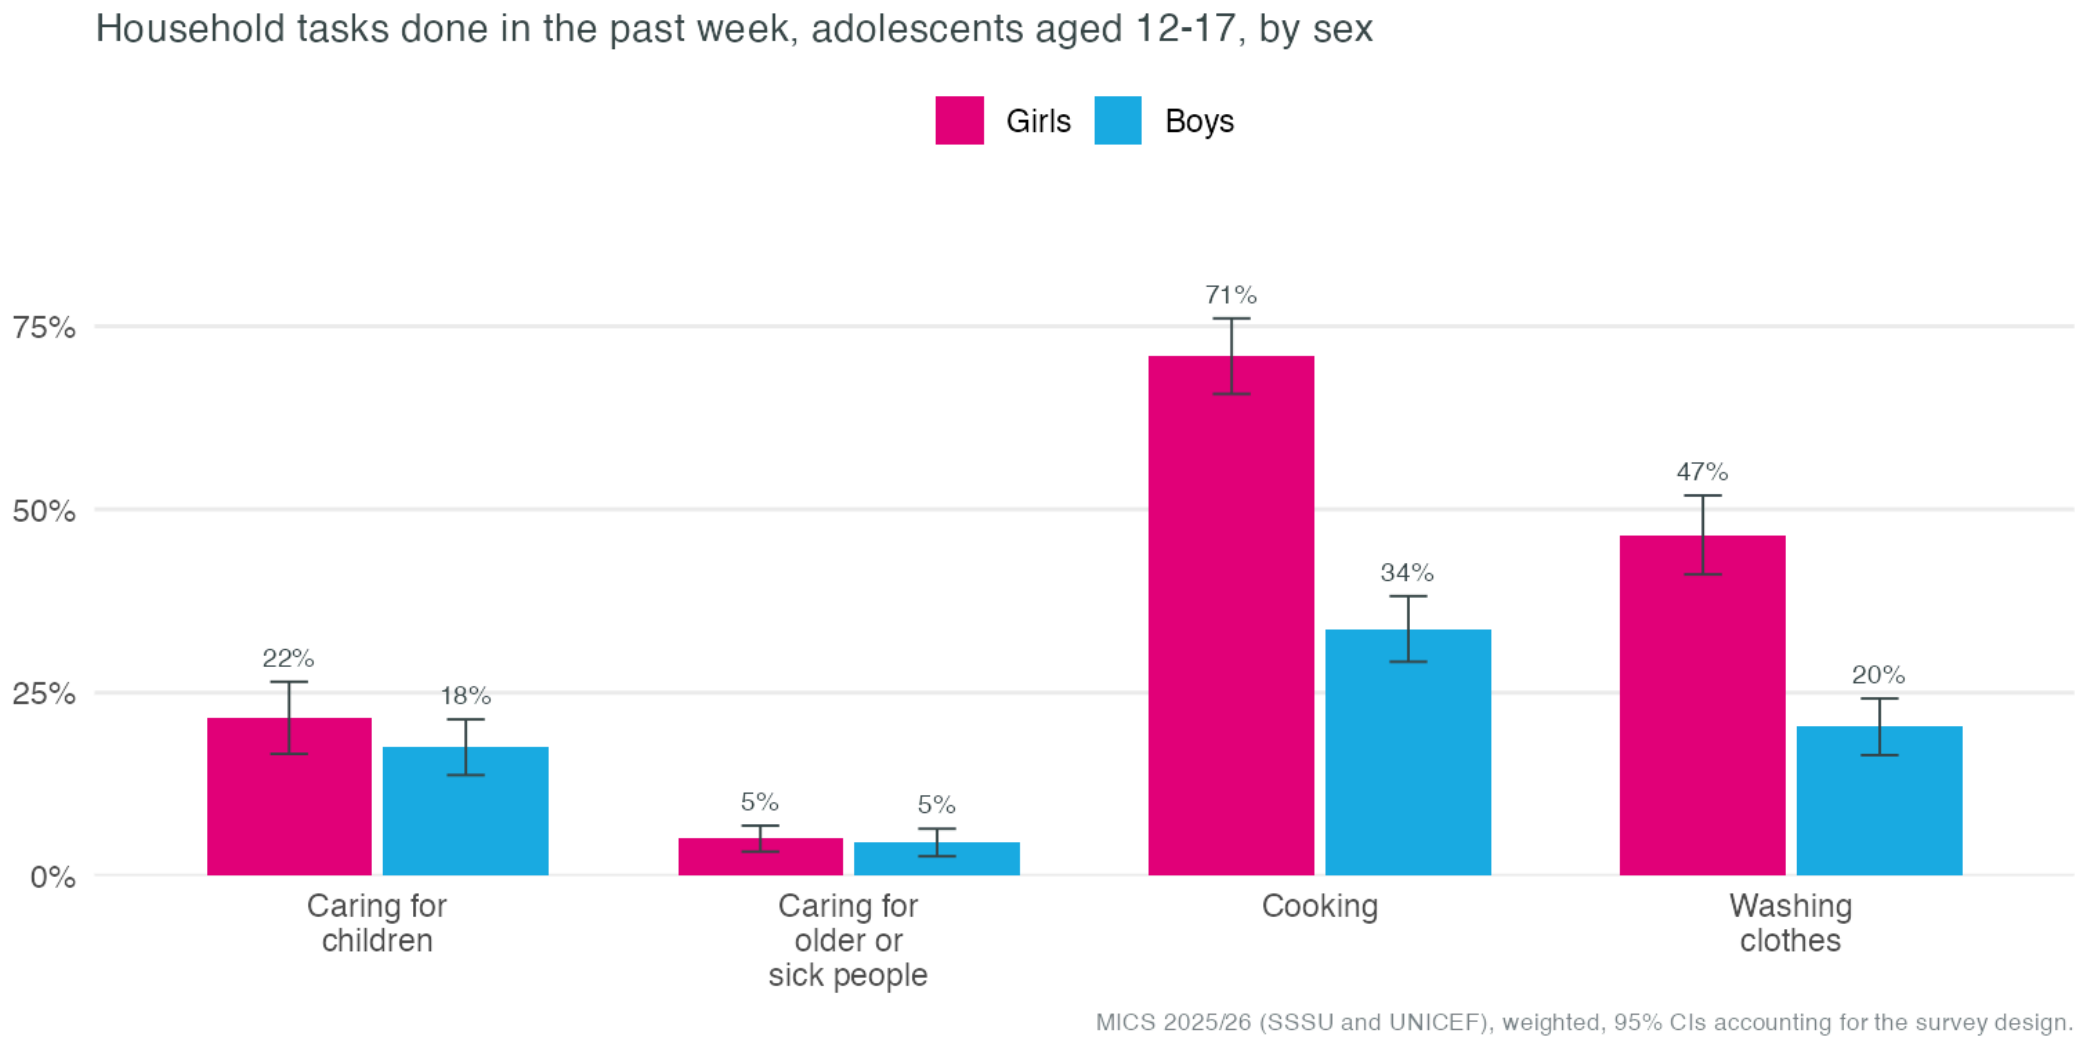

MICS 2025/26, children under 18 living in a household with a woman aged 18–24. Household wealth quintiles. This links young women's exclusion to the economic situation of the children in their households.

HSESS, ages 18–24: 19% of women and 2% of men care for their children daily; NEET among women who care daily is 78%, among others 16%

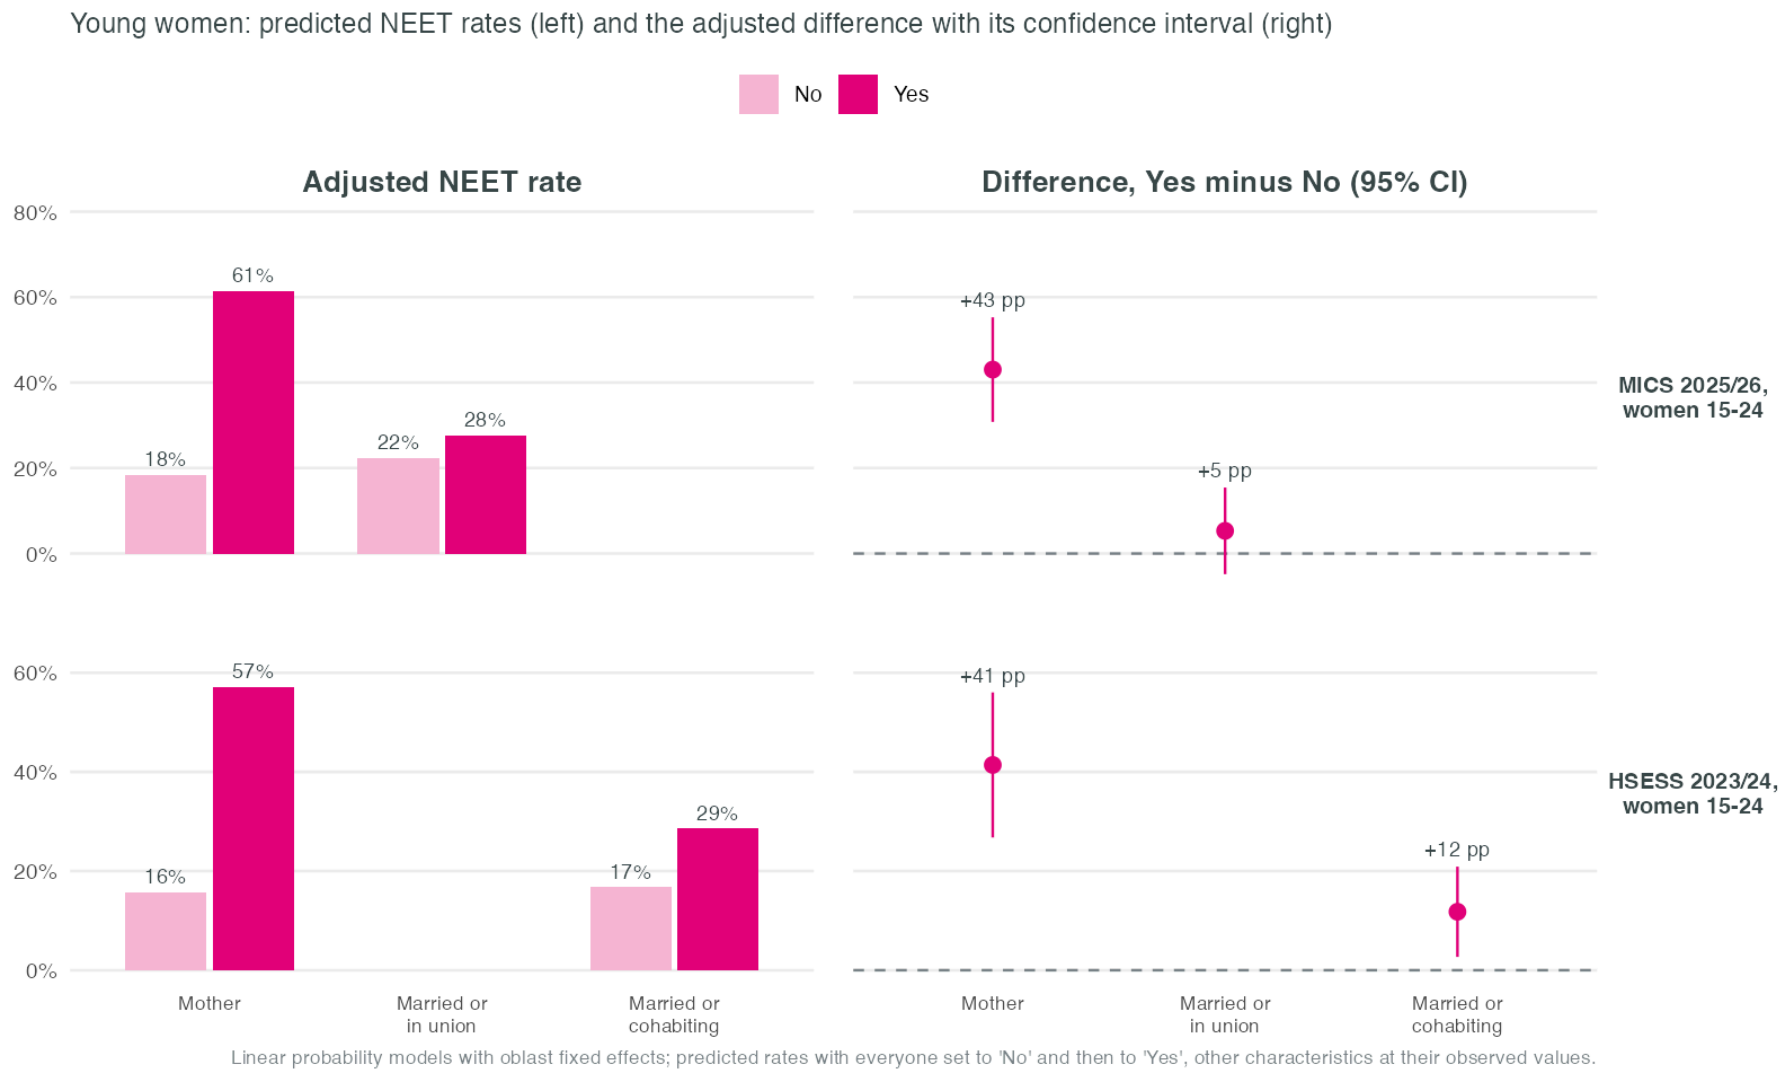

HSESS 2023/24, ages 18–24. Left: share who care for or teach their own children every day. Right: NEET rate by daily childcare, for women and men.

Care work starts in adolescence: 22% of girls and 18% of boys aged 12–17 cared for children in the past week

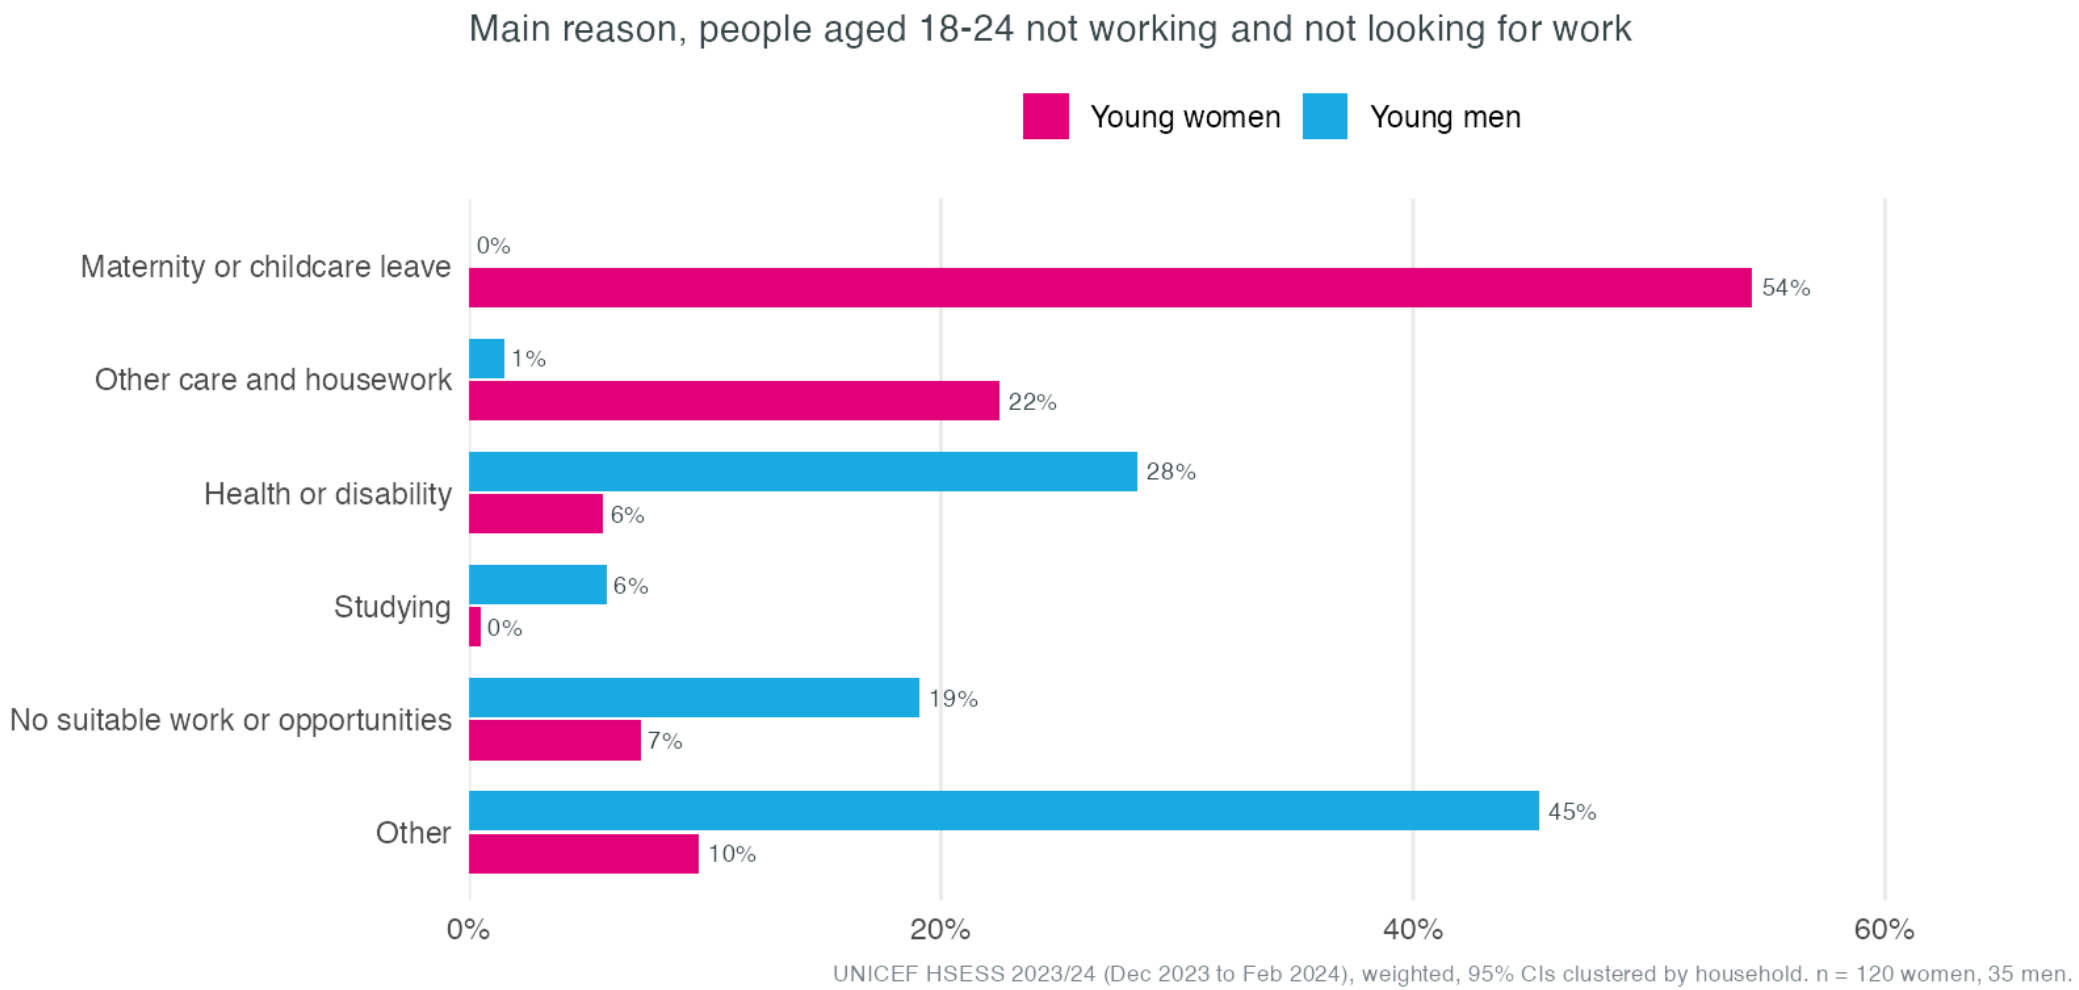

MICS 2025/26, one randomly selected child aged 5–17 per household; shown for ages 12–17.

Motherhood remains associated with NEET after adjusting for other characteristics

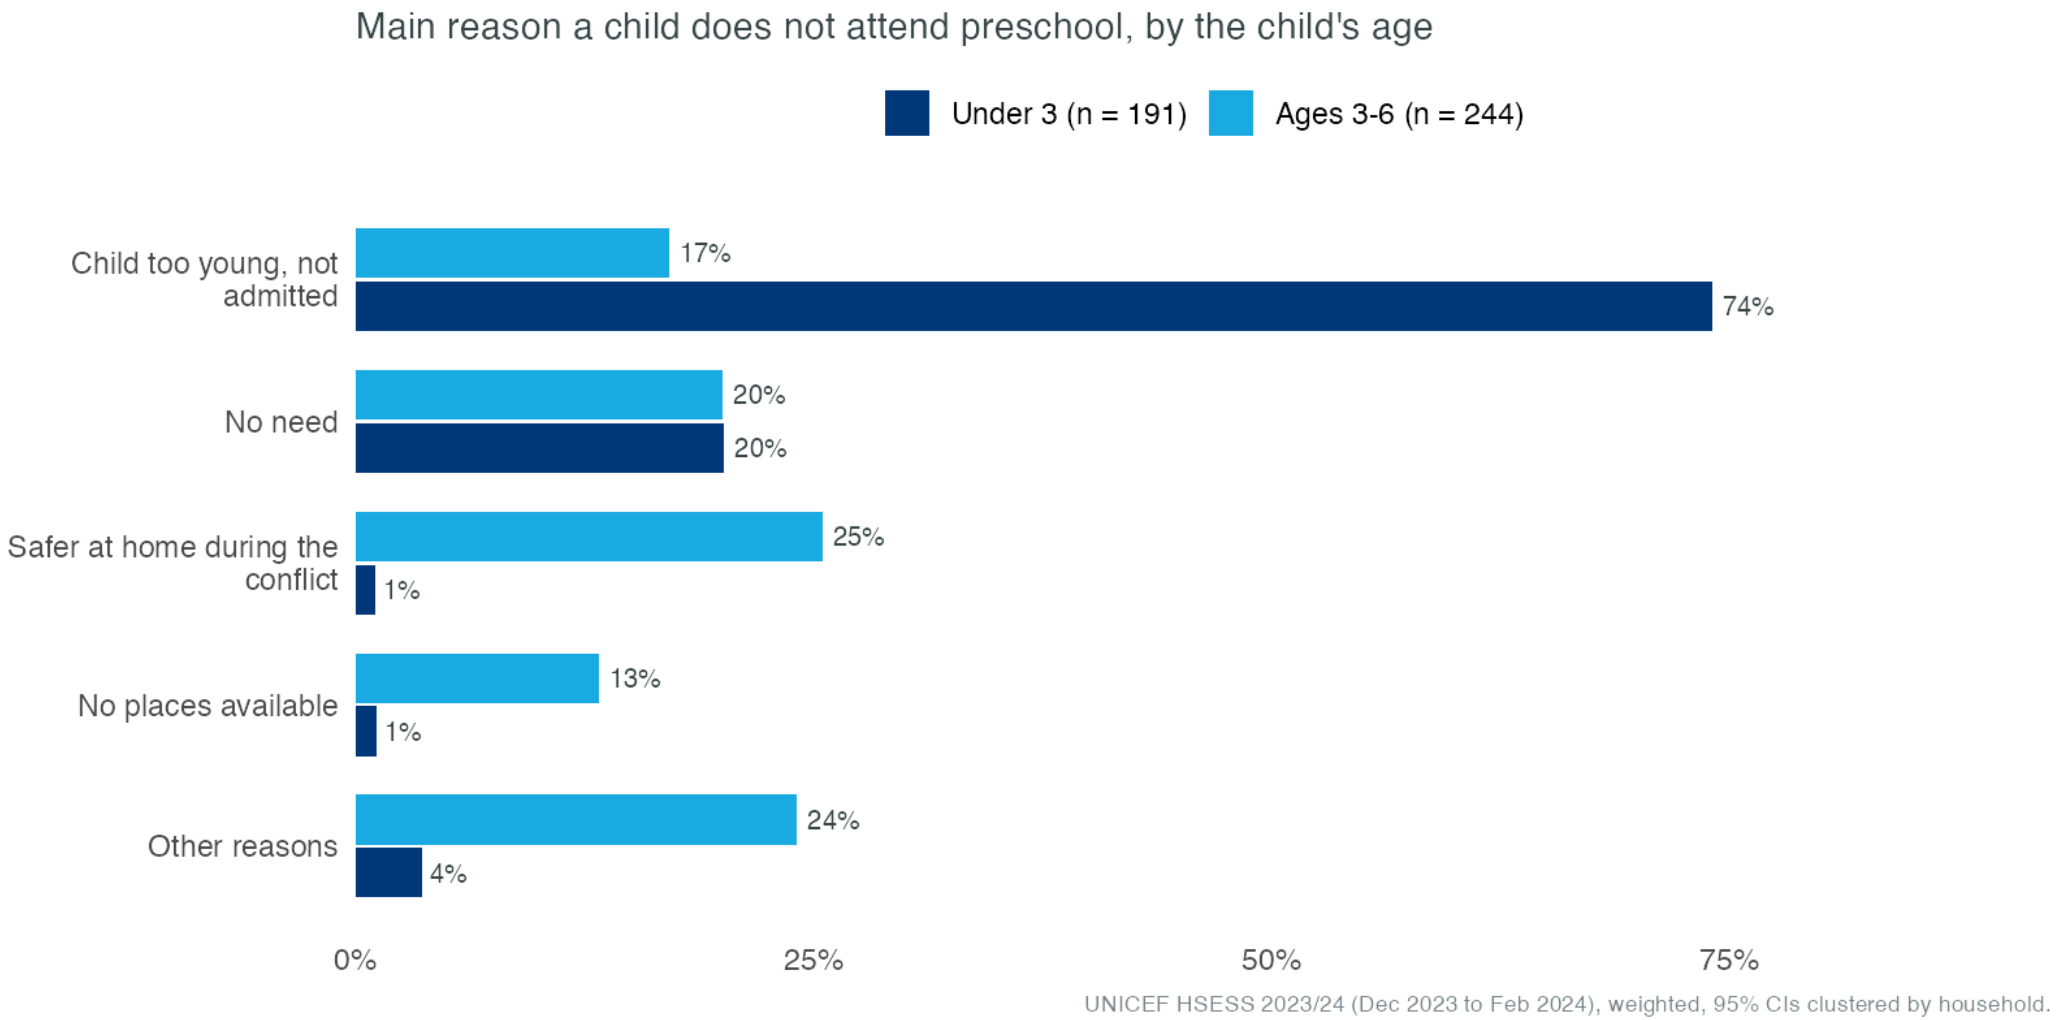

Motherhood remains strongly associated with NEET in both surveys after accounting for measured individual and household characteristics. Left: predicted rates from linear probability models with oblast fixed effects (everyone set to ‘No’, then to ‘Yes’). Right: the difference with its 95% confidence interval. Associations, not causal effects.

Why young women are not working and not looking for work

HSESS 2023/24. Denominator: people aged 18–24 who were not employed and not looking for work at the time of the interview; those in education are included only if they were not working or seeking work. Maternity or childcare leave is shown separately from other care and housework.

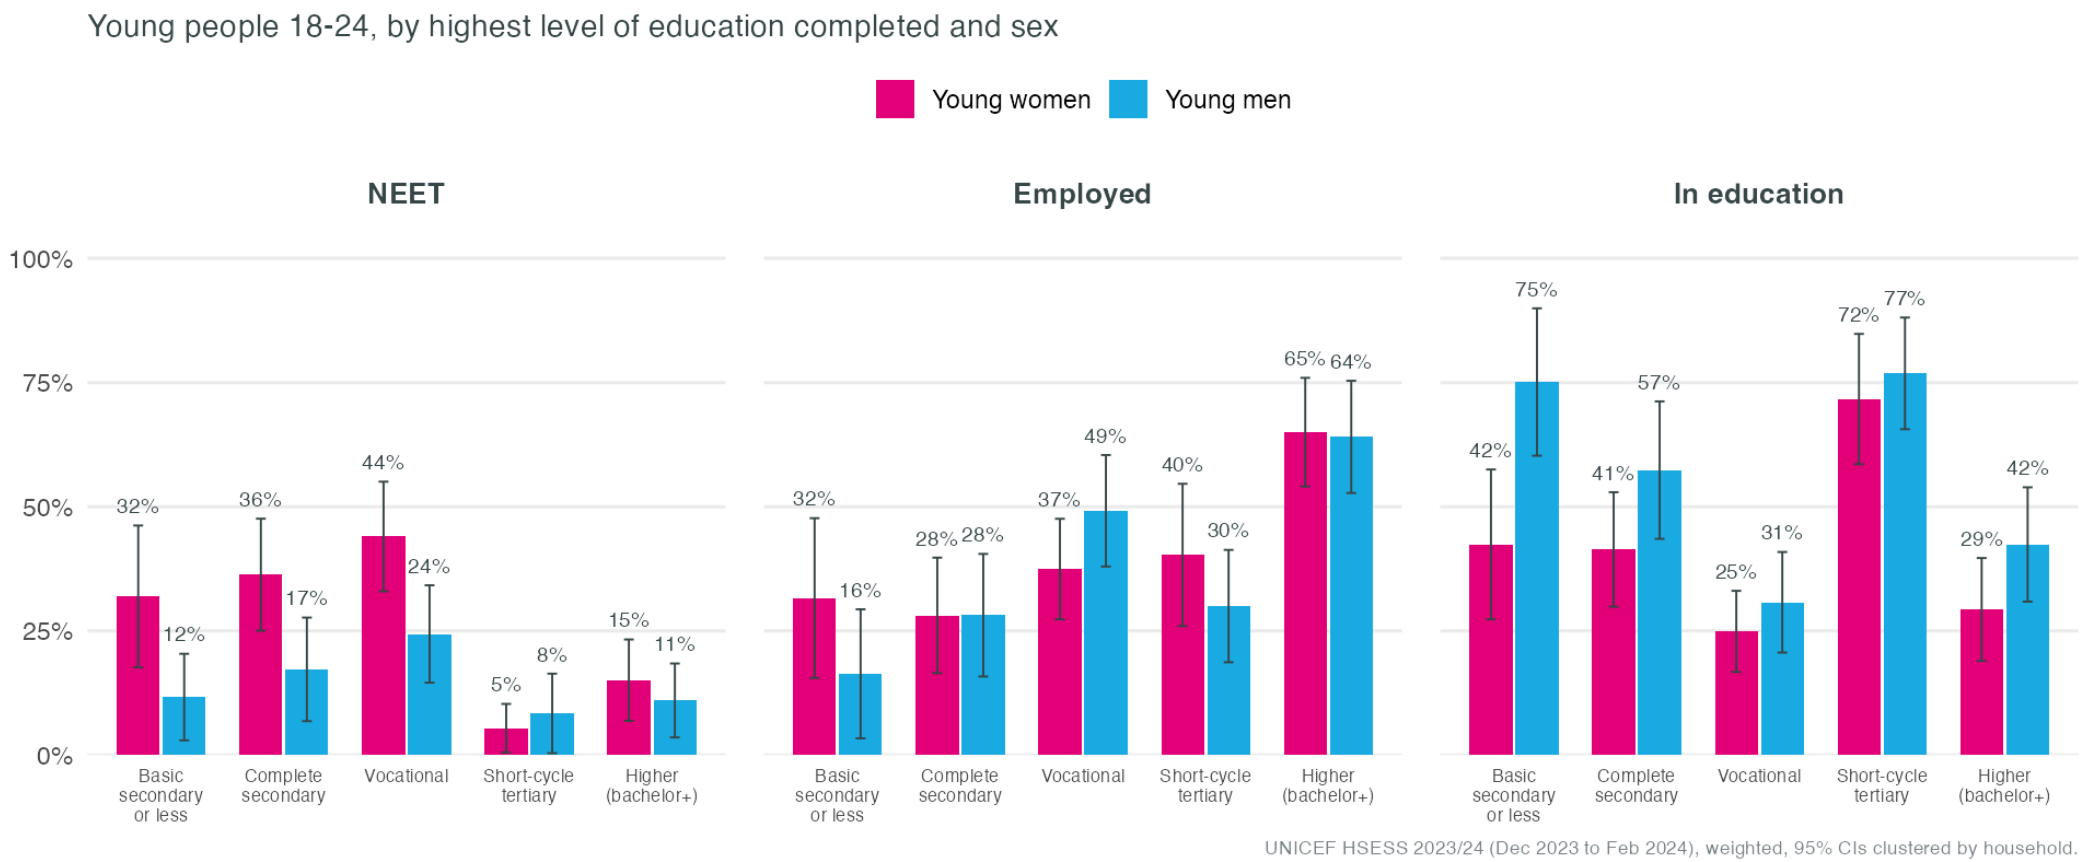

Childcare barriers differ by the child’s age; preschool attendance is 60% at ages 3–5

HSESS 2023/24: main reason a child does not attend preschool, for children under 3 and aged 3–6 (n is the number of children in each group; the four most frequent reasons are shown, the rest grouped as other). Attendance at ages 3–5 is from MICS 2025/26 (by single year of age in the appendix). Barriers at the youngest ages concern admission age; at 3–6 they concern safety and places, which points to age-appropriate provision, safety measures and access support.

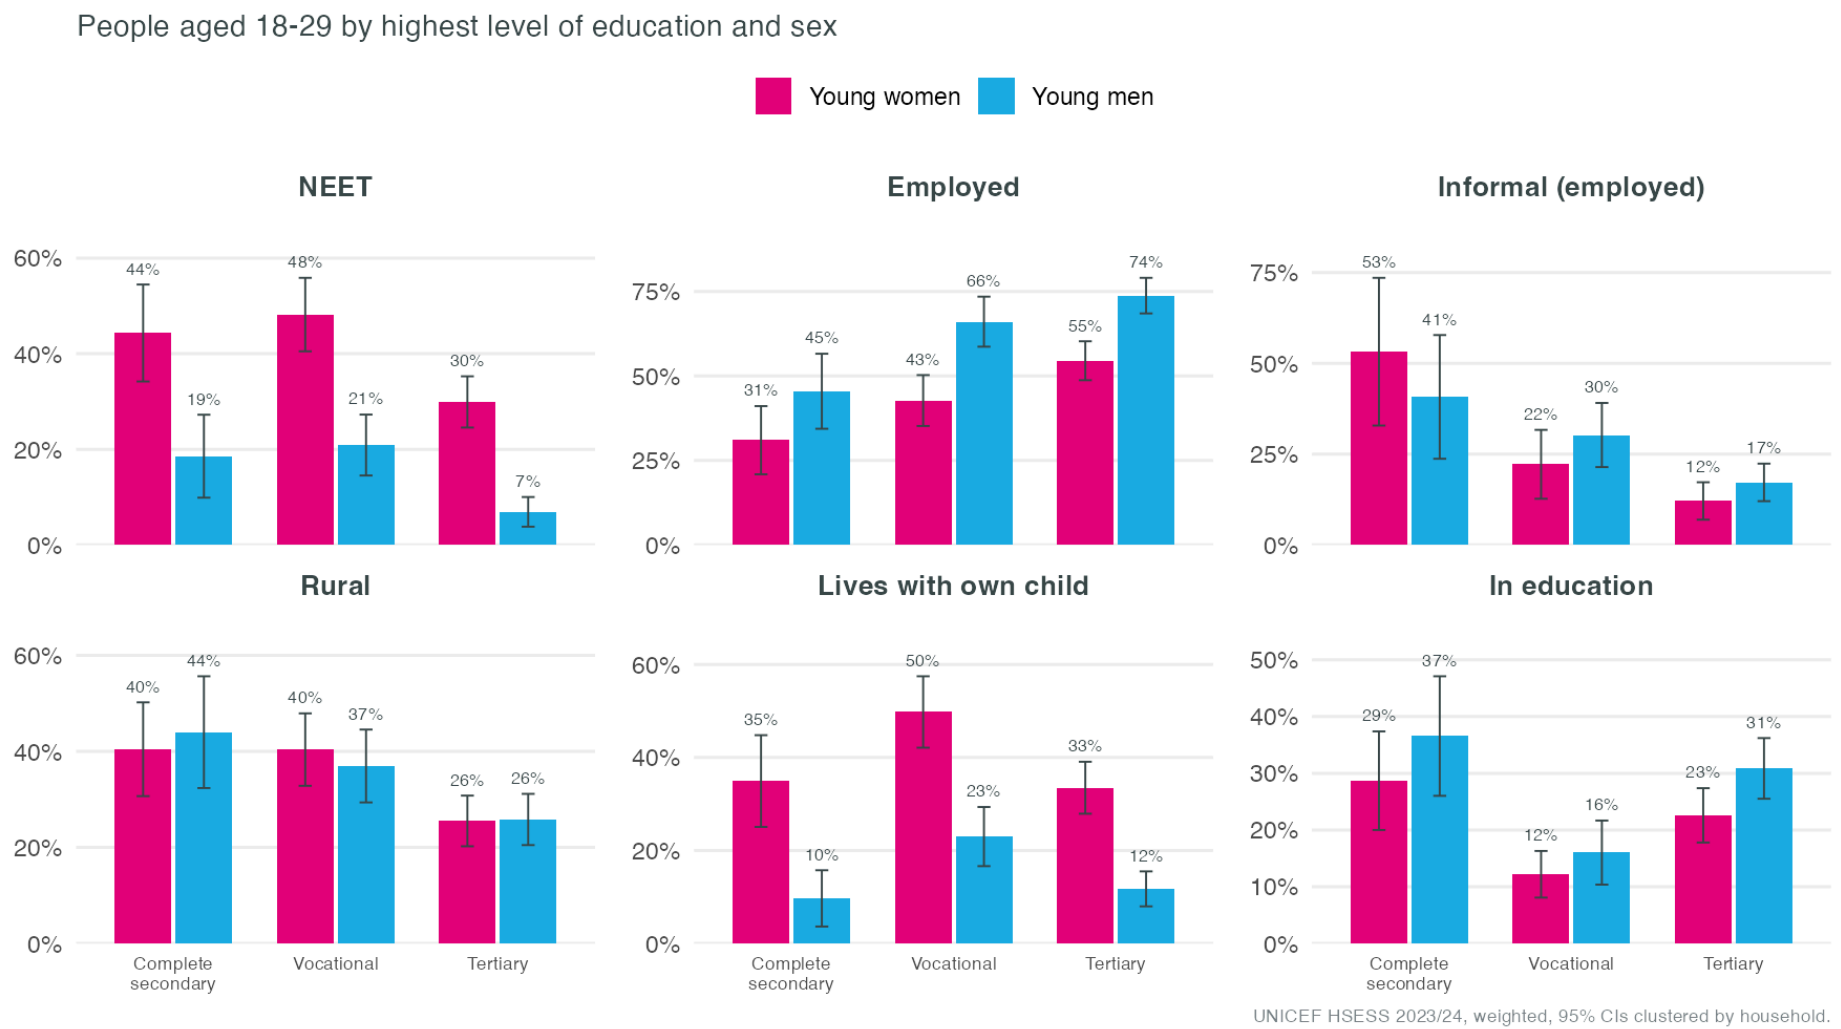

3 · Education, vocational training, earnings and job quality

NEET at 18–24: 15% of women with higher education, 36% with complete secondary

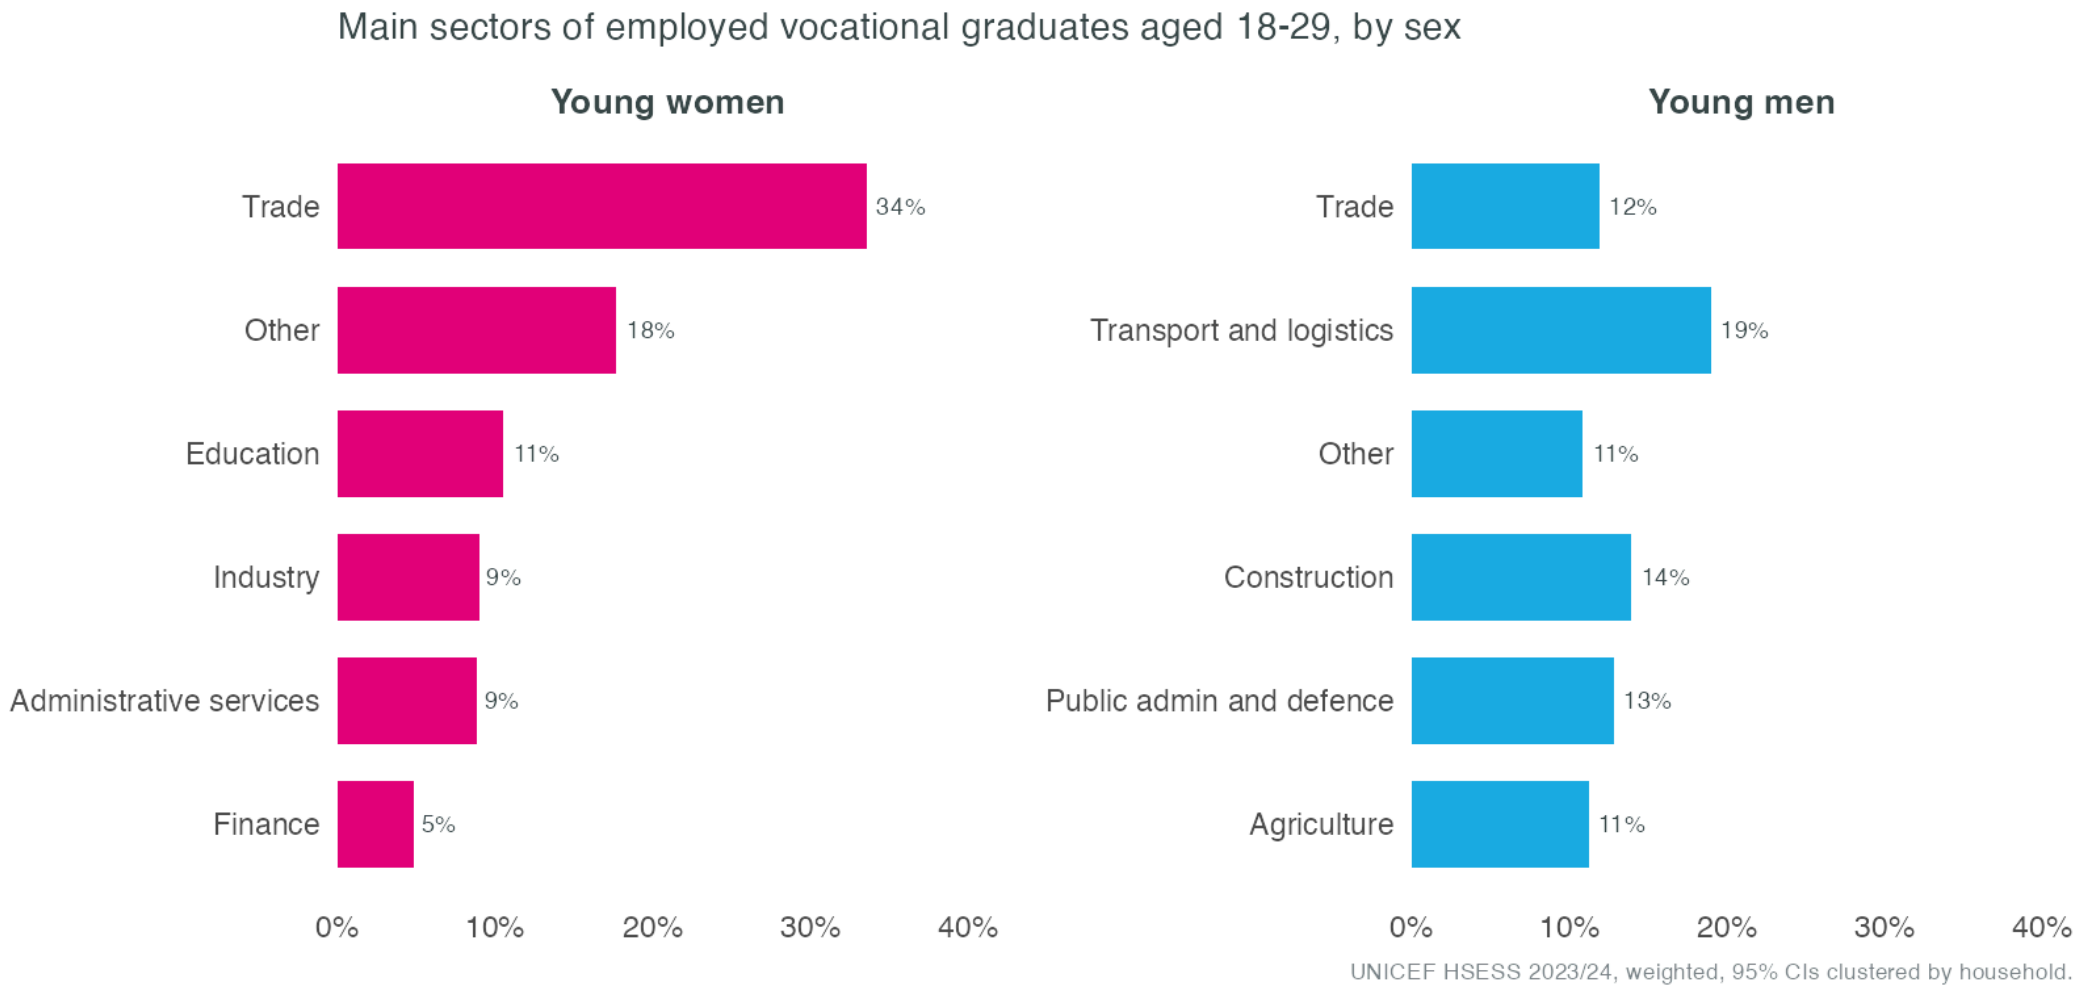

HSESS 2023/24. Highest level completed at the time of the interview, alongside the share still in education. Many 18–24 year olds are still studying, so rates by level should be read together with enrolment.

Vocational graduates: NEET is 48% among women aged 18–29 with vocational education, 44% with complete secondary and 30% with tertiary

HSESS 2023/24, ages 18–29. Vocational graduates compared with complete secondary and tertiary graduates on NEET, employment, informality, rural residence, motherhood and current enrolment, for women and men. Composition differences (more rural, more mothers, fewer still studying) are candidate explanations for the vocational finding.

Employed vocational graduates aged 18–29 work in different sectors by sex

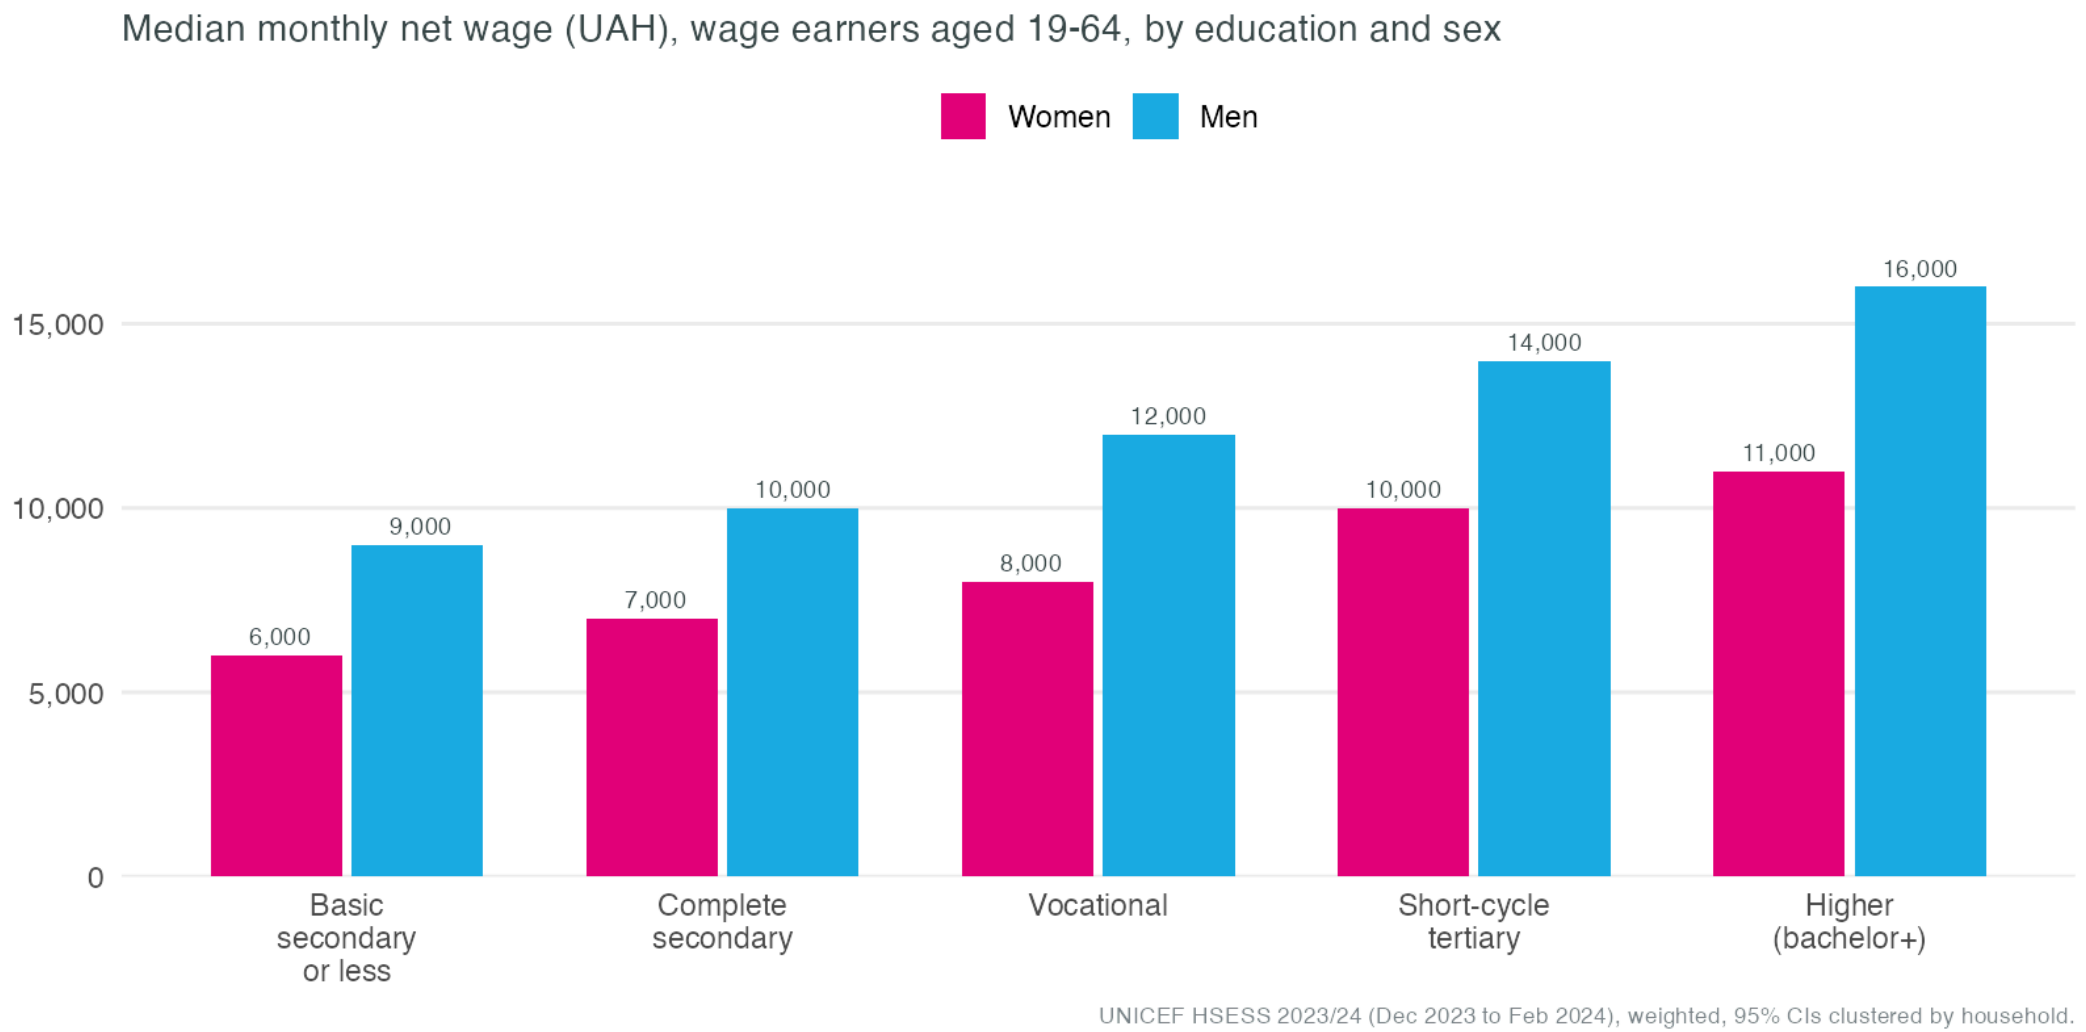

HSESS 2023/24, employed vocational graduates aged 18–29, six largest sectors by sex. Where women's and men's sectors differ, sector segregation is one channel through which vocational education can lead to lower-paid work for women.

The vocational gap in NEET moves from 6 pp to -5 pp once motherhood, area, income and displacement are accounted for

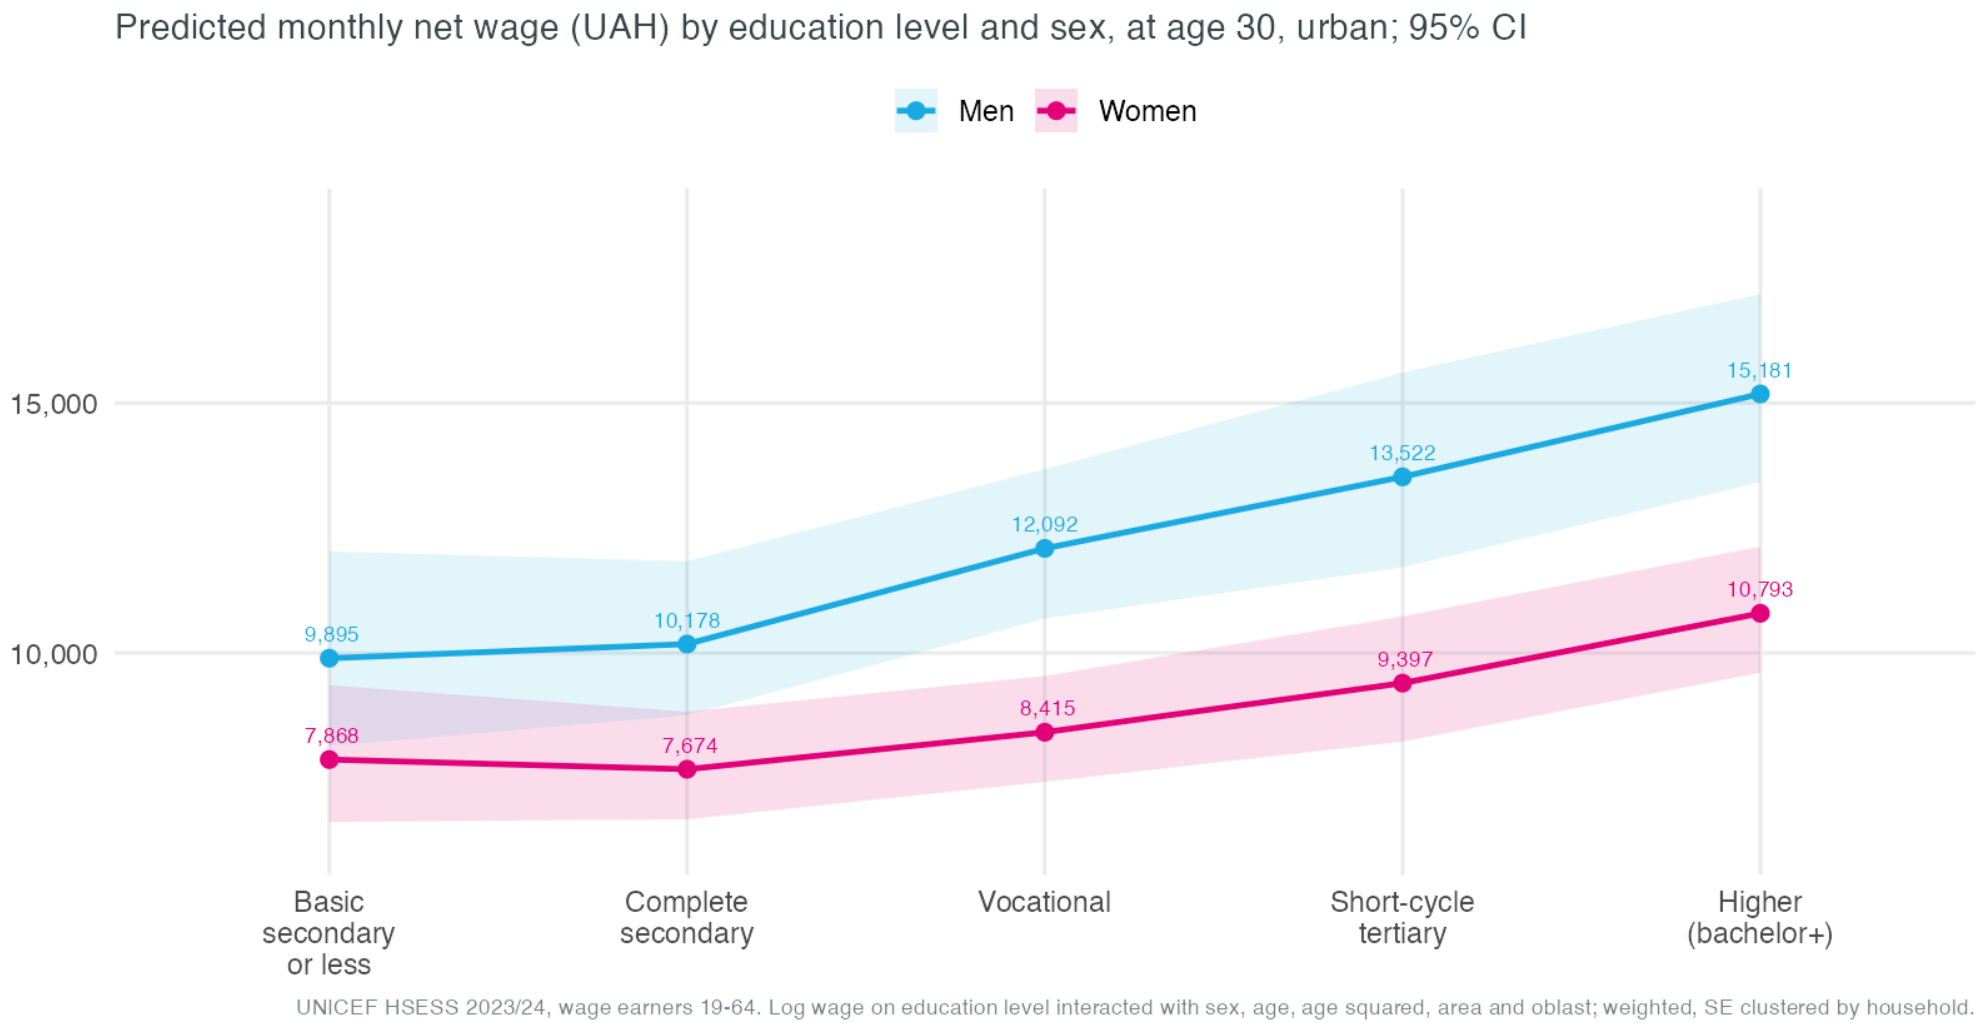

HSESS 2023/24, women aged 18–29. Difference in the NEET rate between women with vocational and with complete secondary education, from linear probability models with oblast fixed effects, adding controls step by step. A gap that shrinks with controls points to composition (who enters vocational education); a gap that persists points to the match between vocational fields and available jobs.

Median wage by education: UAH 11,000 for women with higher education, UAH 7,000 with complete secondary

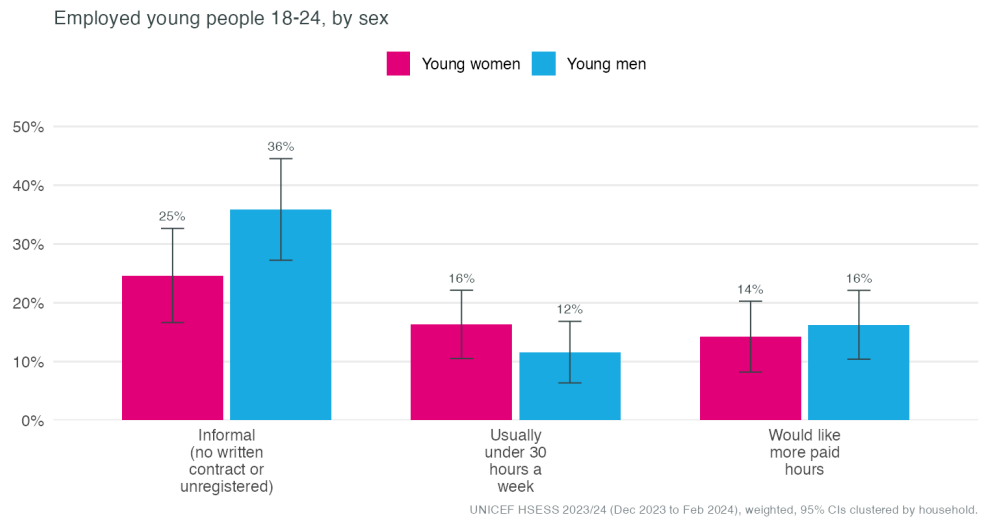

HSESS 2023/24, wage earners aged 19–64, net monthly wage, medians by level and sex. The returns to a year of education estimated in the appendix are 5.8% for women and 7.2% for men.

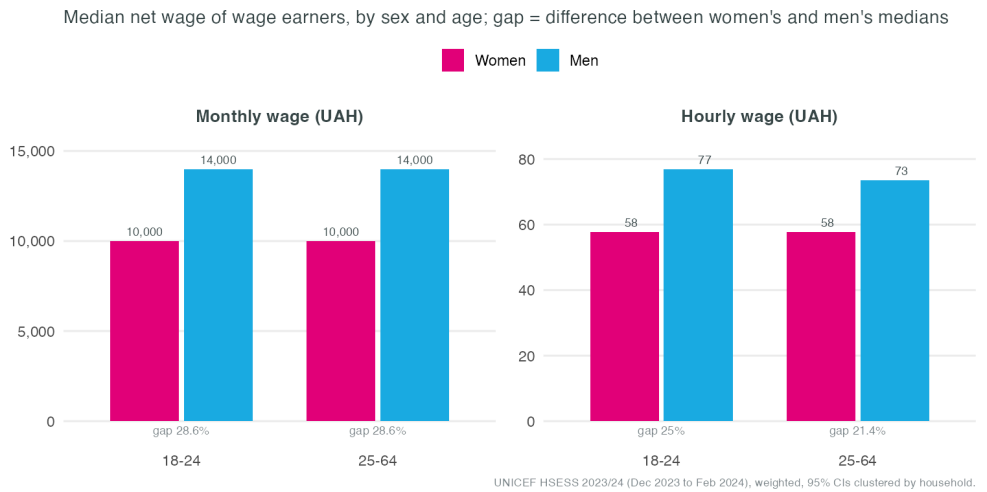

Adjusted for age and area, the wage gap between women and men is 25% with complete secondary and 29% with higher education

HSESS 2023/24, wage earners aged 19–64 (not specifically young women). Predicted net monthly wage at age 30 in an urban area, from a log-wage model with education level interacted with sex, age, age squared, area and oblast dummies. Women have lower predicted monthly wages at comparable ages, locations and qualifications; the model does not adjust for hours worked, occupation or sector, so the gap also reflects differences in working hours and occupations.

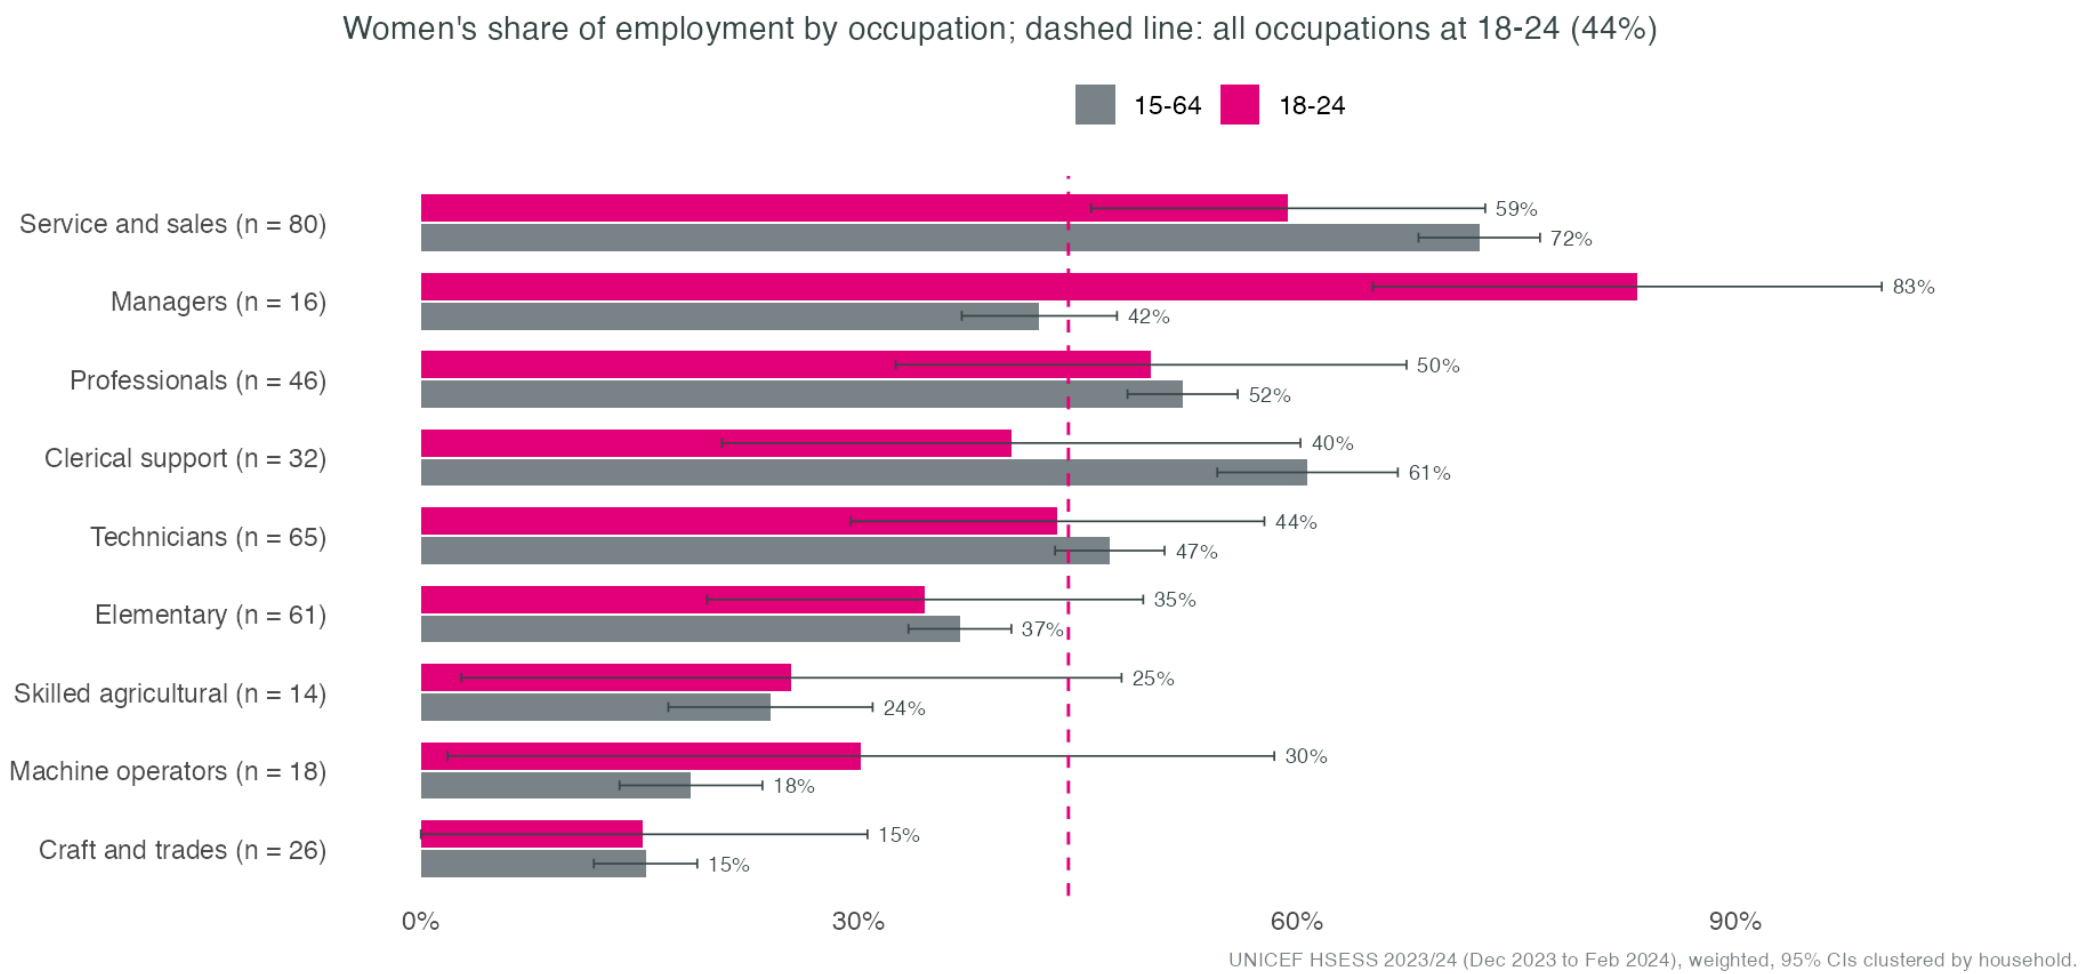

Job quality at 18–24: informal work 25% of employed women vs 36% of men; hourly wage gap 25%

HSESS 2023/24. Left: employed people aged 18–24; young women have a lower measured rate of informal employment than young men. Right: median net wages of wage earners by sex; the monthly gap includes differences in hours, the hourly gap removes them. Neither adjusts for occupation or sector.

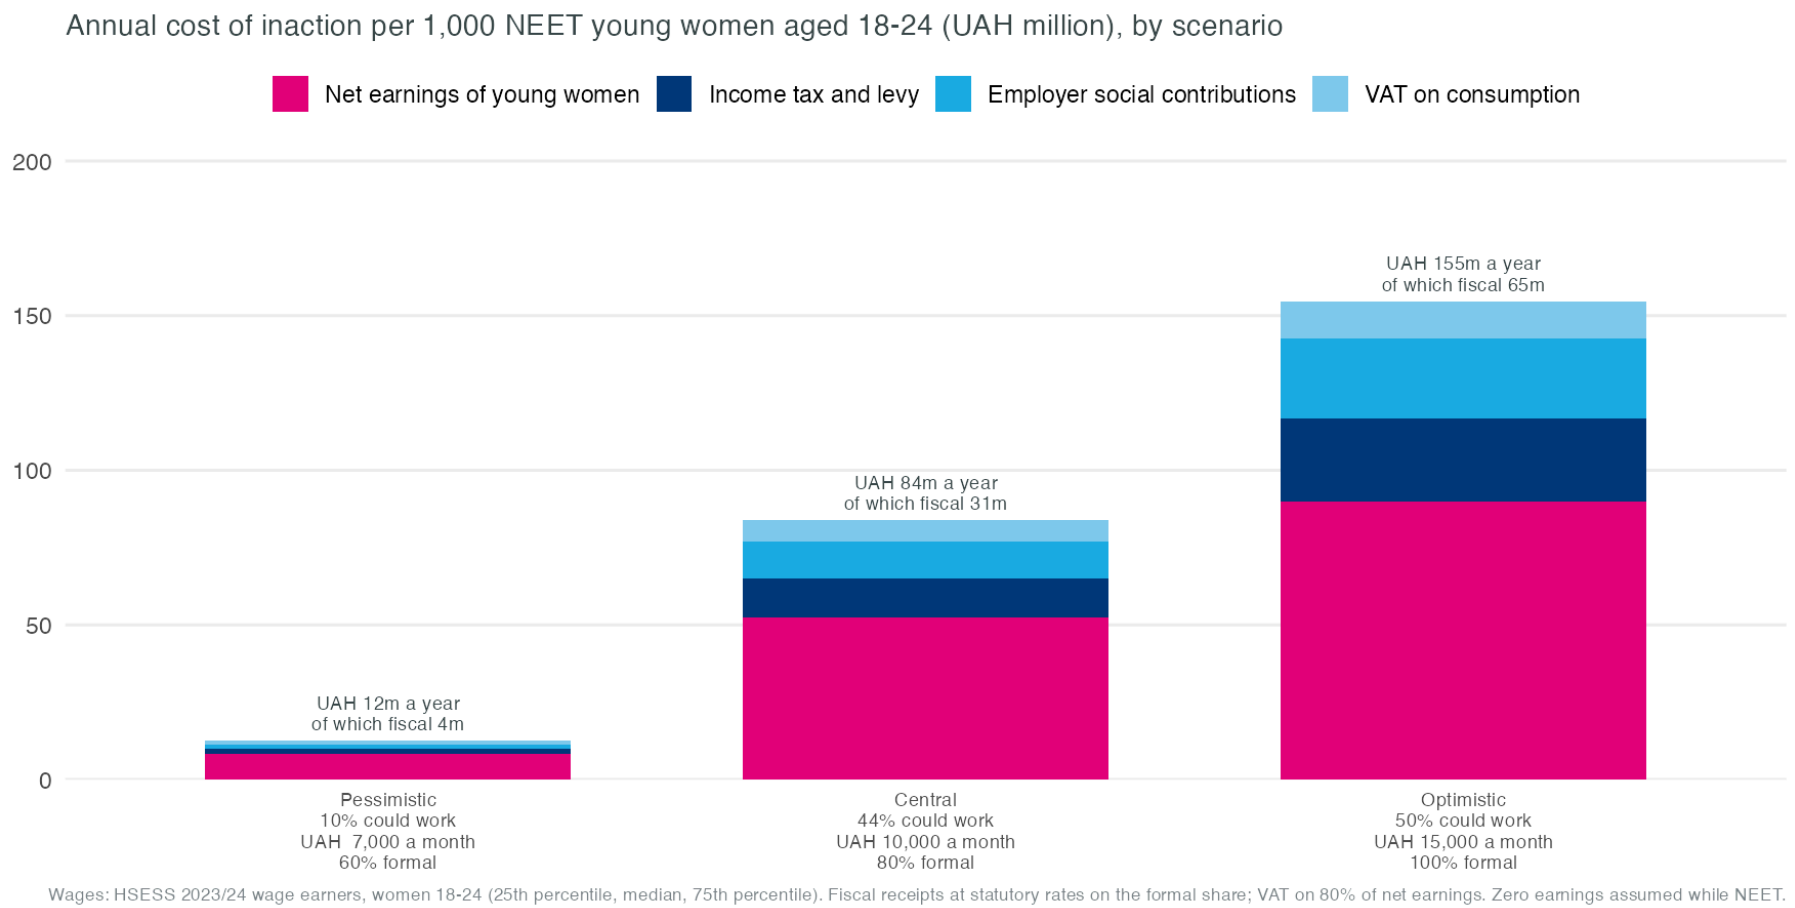

Young women and men work in different occupational groups; selecting pathways requires evidence on demand, pay and entry requirements

HSESS 2023/24. Women's share of employment by occupation group, as reported by the respondent (IND_B6_2); groups at 18–24 are small (n shown). This answers where young women and men currently work; it does not identify which pathways to invest in. That requires current evidence on vacancies, pay and entry requirements by occupation, traditional and non-traditional, which the surveys do not contain.

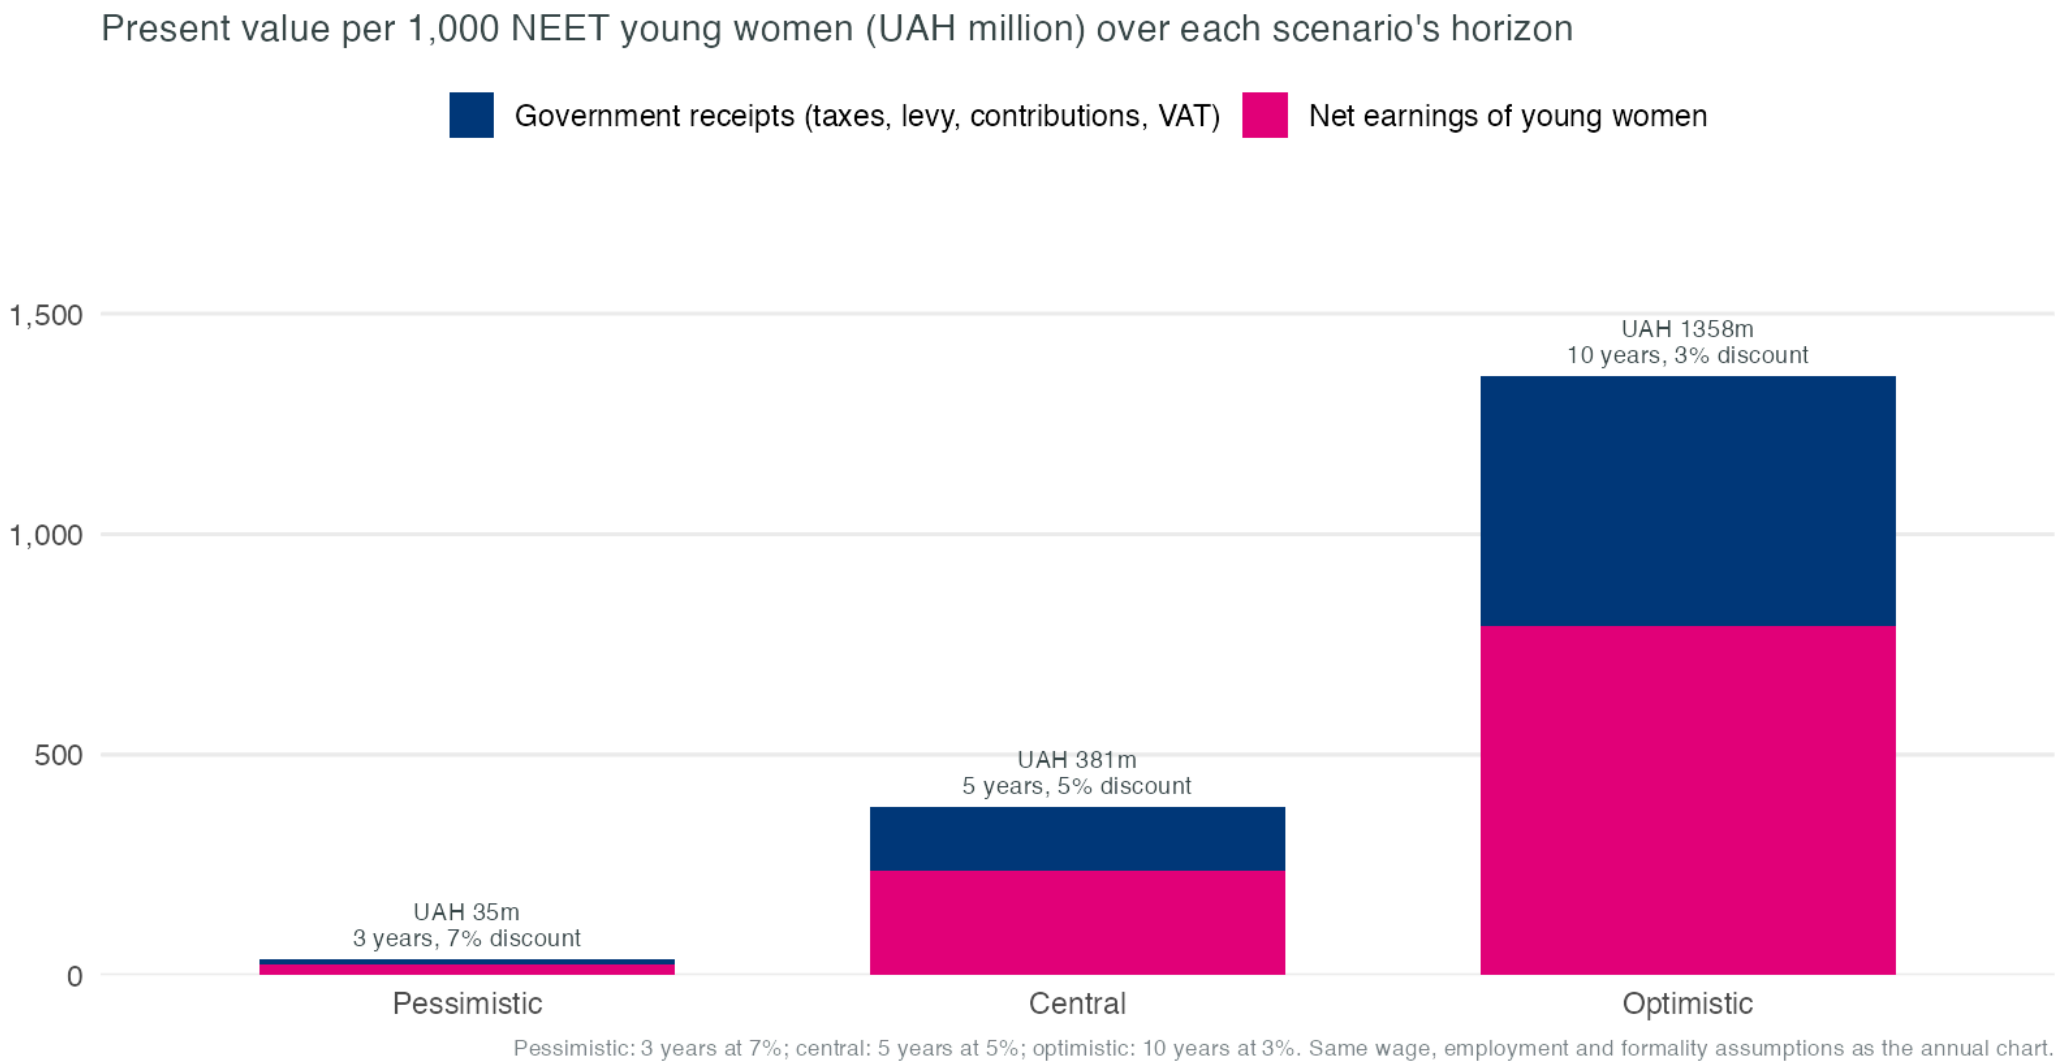

4 · The cost of young women remaining NEET

Each year, 1,000 NEET young women forgo about UAH 84 million in earnings and receipts under the central scenario, of which UAH 31 million would reach the budget

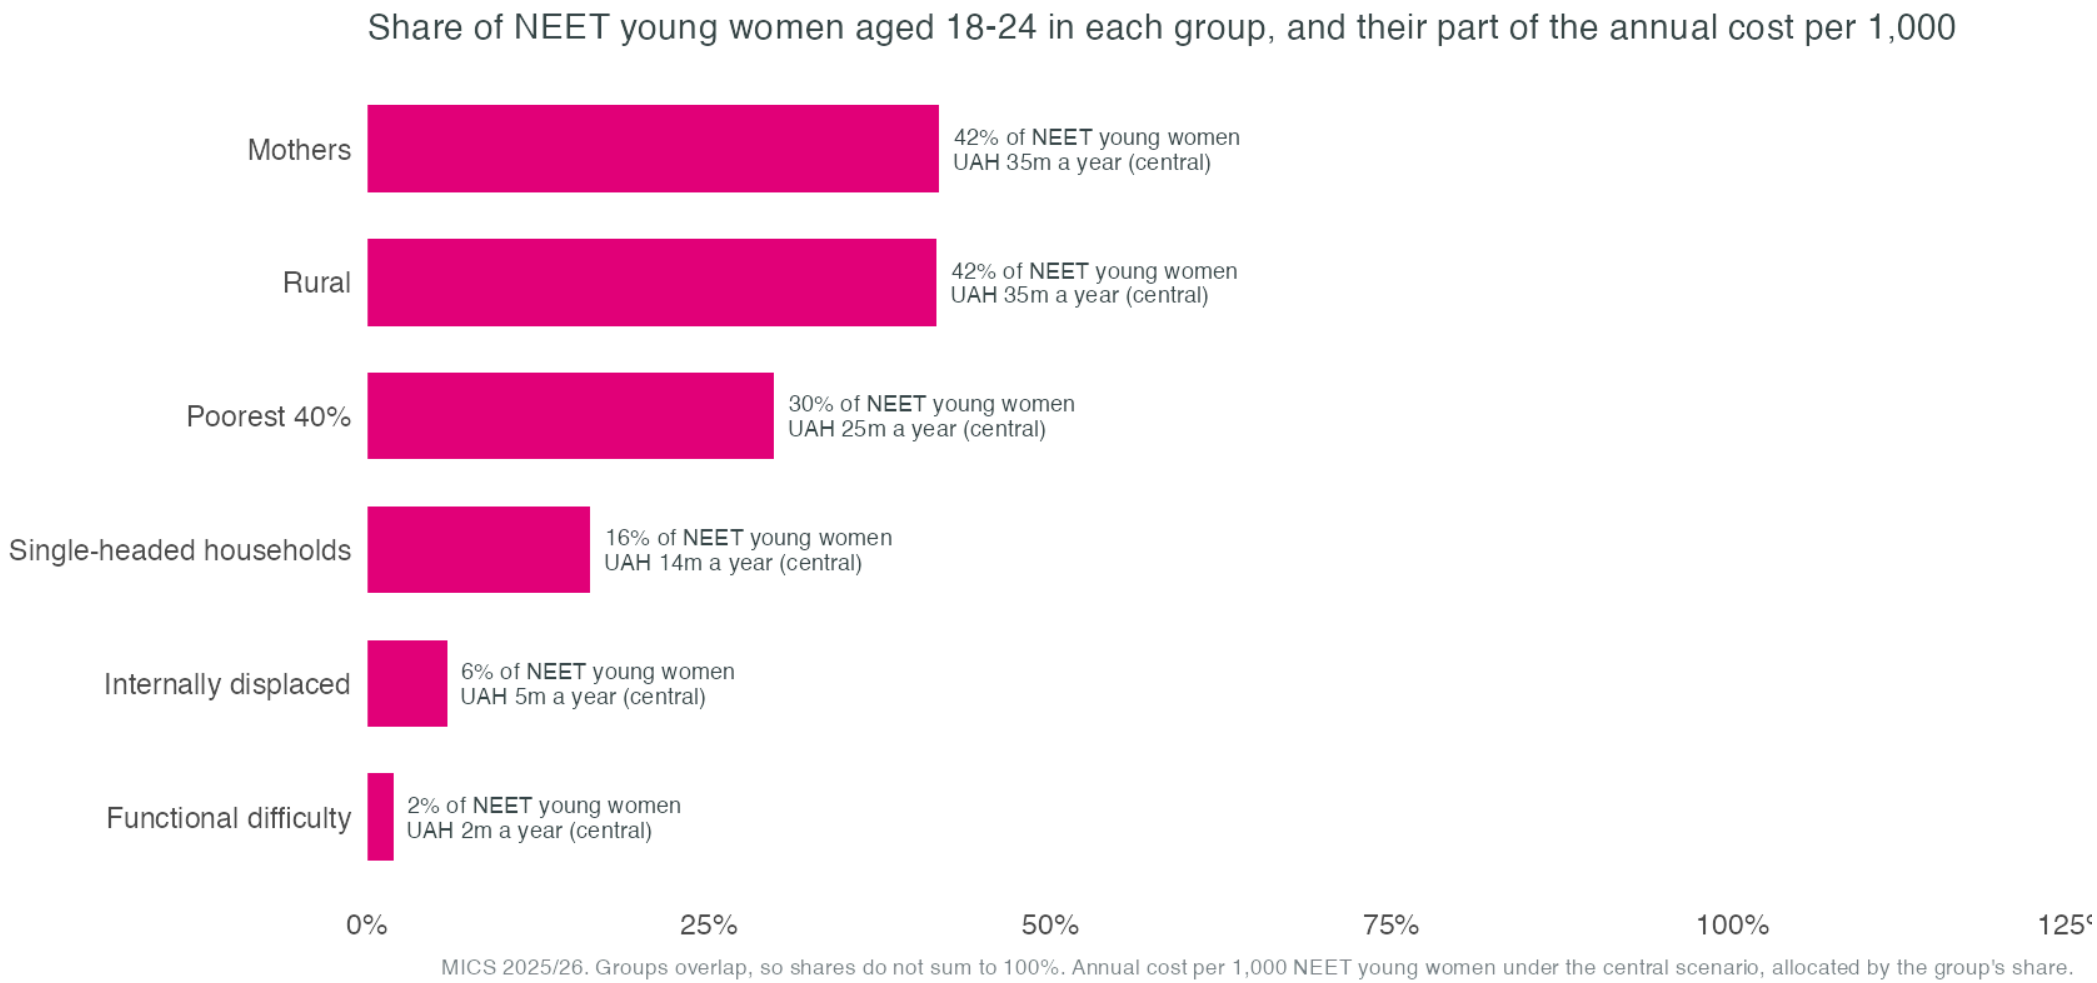

Women aged 18–24 (NEET rate 30.8%, MICS 2025/26). Pessimistic: 10% could work, 25th percentile wage, 60% formal. Central: closing the gap with young men (44% of NEET women), median wage, 80% formal. Optimistic: 50%, 75th percentile wage, all formal. Wages from HSESS 2023/24 (n = 180 women aged 18–24 with wages). Fiscal receipts: income tax and levy, employer contributions and VAT on consumption. A woman who remains NEET to age 60 forgoes about UAH 2,162,045 in net earnings and the budget about UAH 1,299,099 (present values, central scenario). National totals require a 2026 count of women aged 18–24.

Over each scenario’s horizon, the present value per 1,000 NEET young women ranges from UAH 35 million to UAH 1,358 million

Pessimistic: 3 years of employment, 7% discount; central: 5 years, 5%; optimistic: 10 years, 3%. Government receipts are shown separately from young women’s net earnings; employer returns are not included.

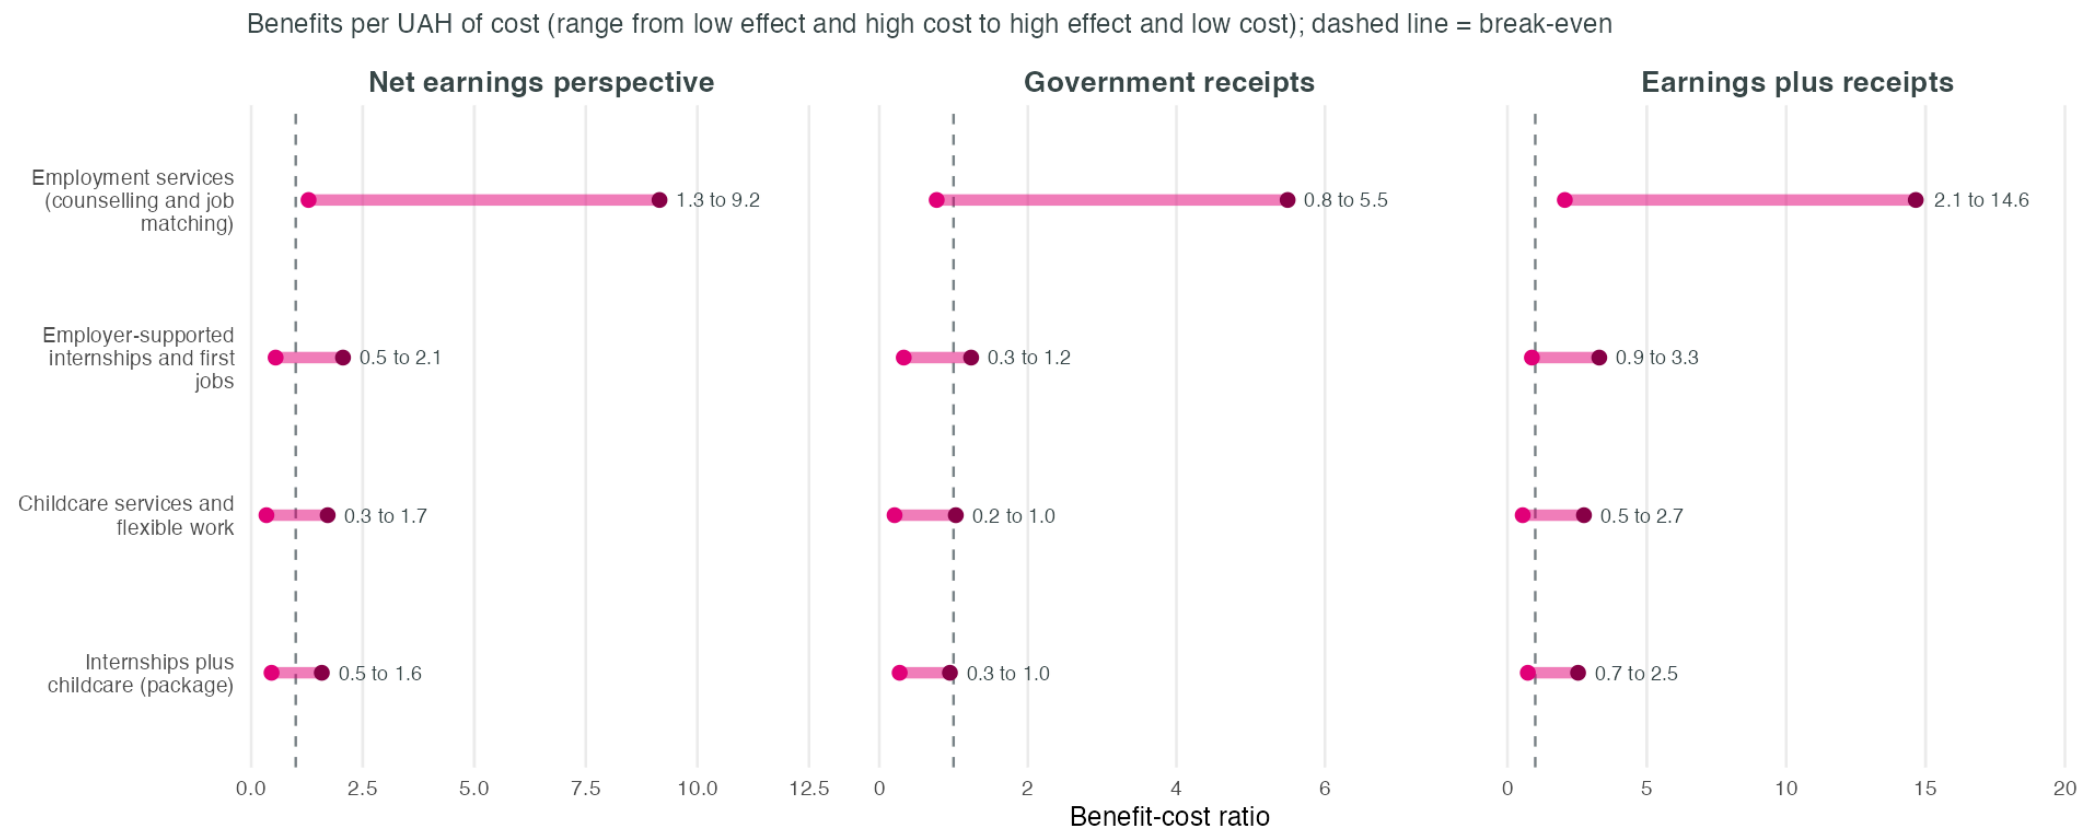

Mothers account for 42% of NEET young women and the poorest 40% for 30%: this is where most of the cost sits

MICS 2025/26, women aged 18–24. Share of NEET young women in each group and the corresponding part of the annual cost per 1,000 under the central scenario. Groups overlap. This shows where the potential gains are concentrated, not that interventions would reach each group equally.

5 · Investment options

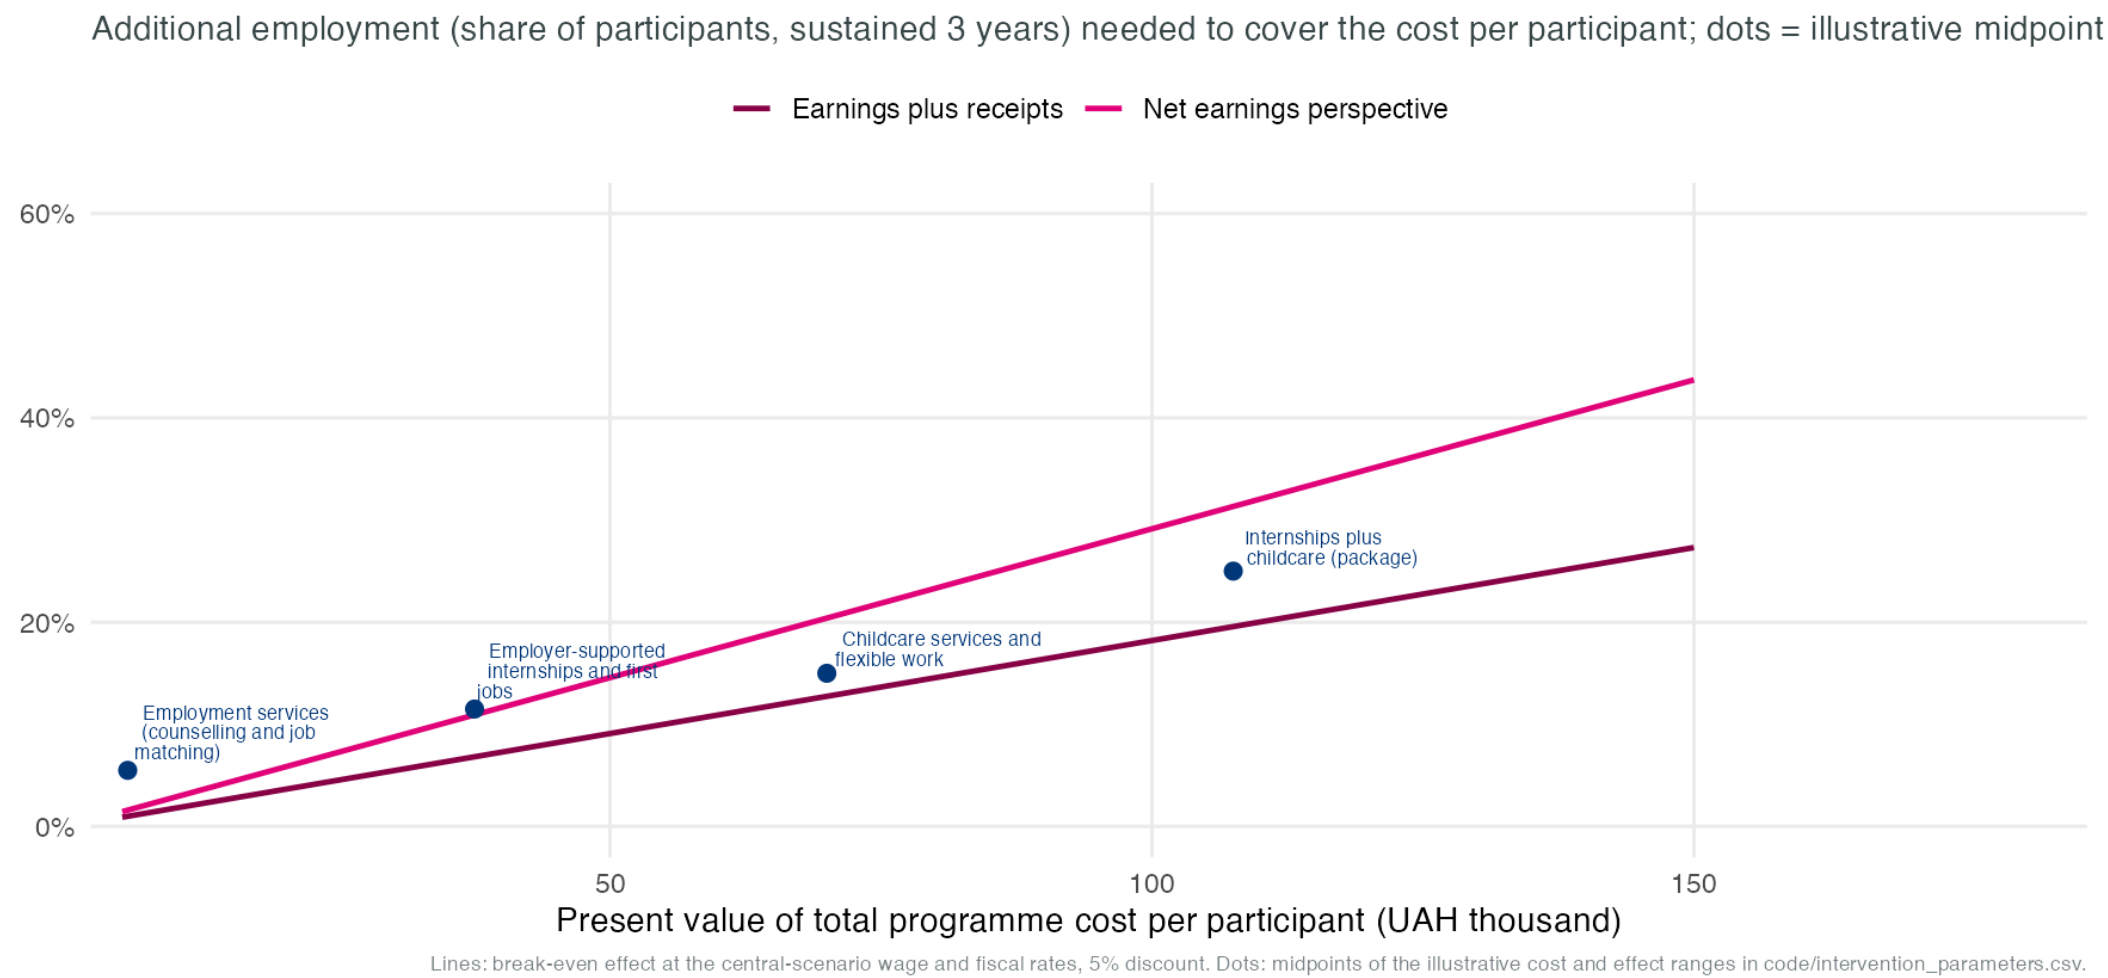

Illustrative returns by intervention type: employment services and internships for all young women; childcare and flexible work for young mothers

ustrative parameters in code/intervention_parameters.csv, to be replaced with country office costs. Benefits: additional employment sustained for 3 years at the central-scenario wage and fiscal rates, 5% discount. Employer returns not included.

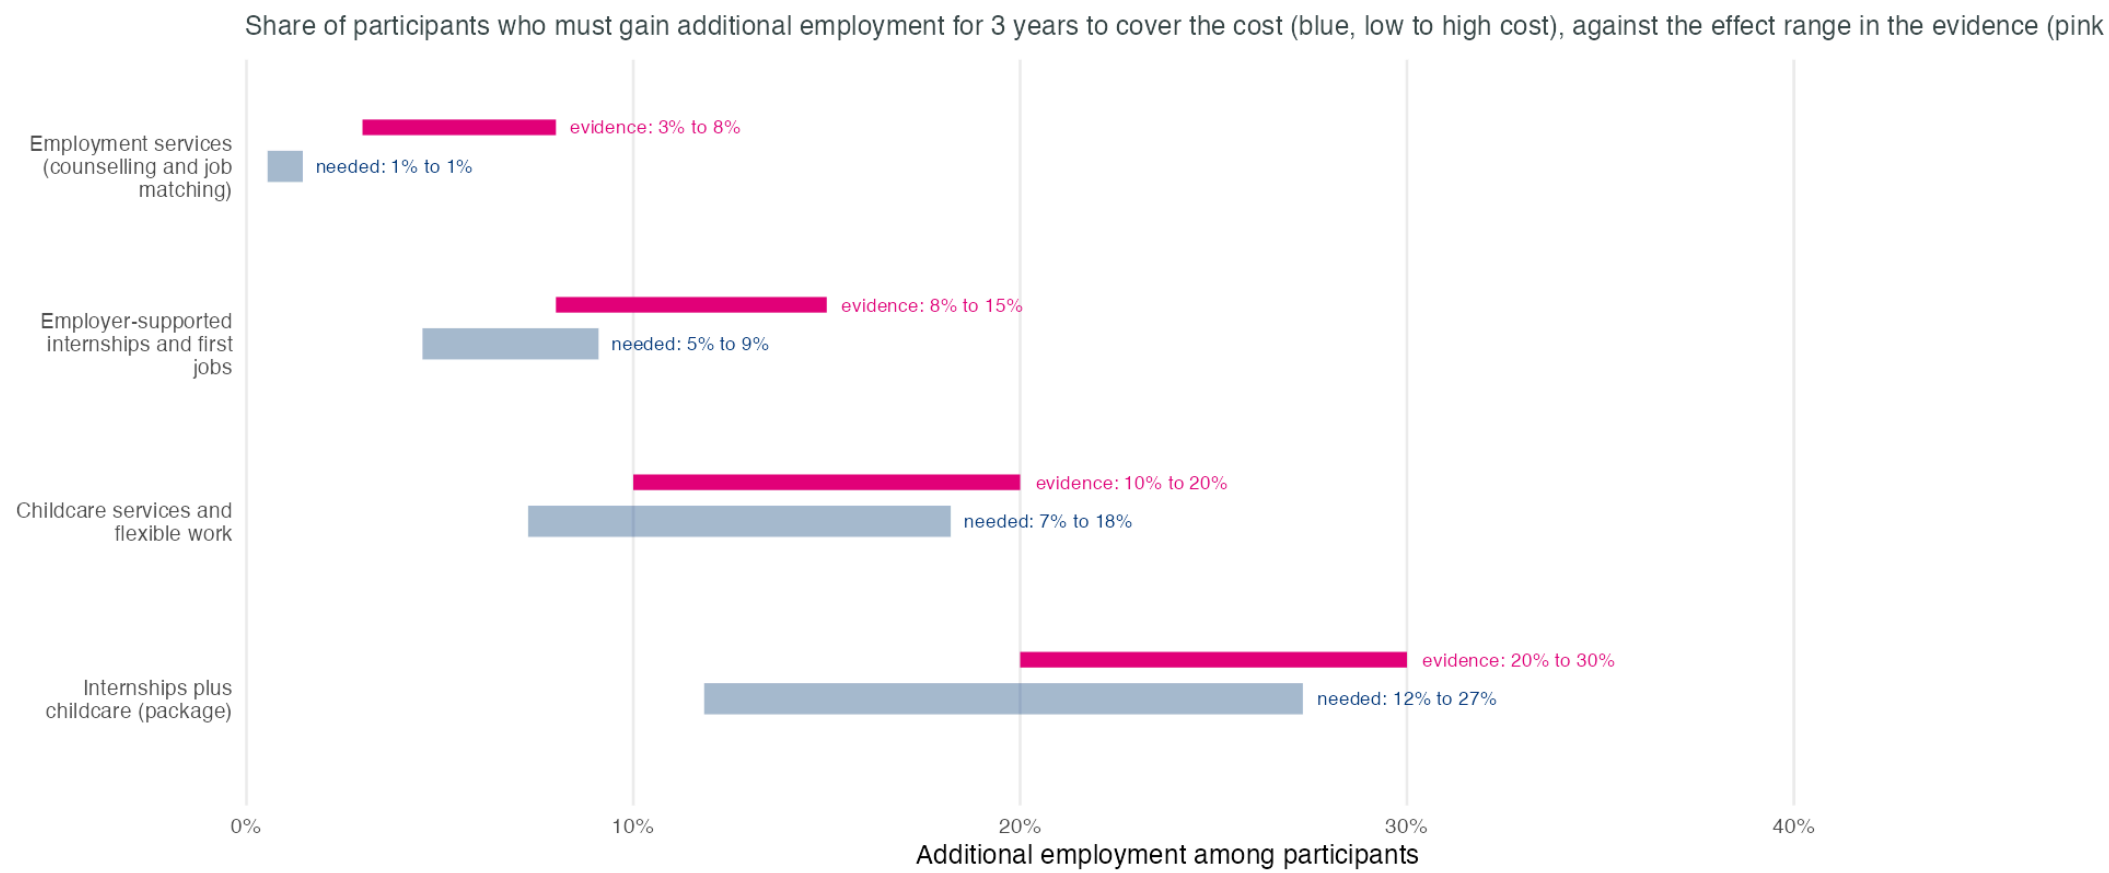

Benefit-cost ratios under low (high cost, low effect) and high (low cost, high effect) assumptions, for three perspectives. Costs and effects are illustrative placeholders in code/intervention_parameters.csv, drawn from international evidence on employment services, internships and childcare; they are to be replaced with country office and partner costs. Benefits: additional employment sustained for three years at the central-scenario wage and fiscal rates. Employer returns are not included.

Break-even: the additional employment each intervention would need to cover its cost, with the illustrative midpoints

Lines: share of participants who must gain additional, sustained employment (three years) for benefits to equal the present value of the total cost per participant, from the net earnings perspective and adding government receipts. Dots: midpoints of the illustrative cost and effect ranges. Recurring costs (childcare, transport) belong in the present value of cost.

Applying the break-even approach: the employment gain each intervention would need, against what the evidence suggests

ırnings plus government receipts, central-scenario wage and fiscal rates, 5% discount. Costs and effect ranges from code/intervention_parameters.csv (illustrative). Pink to the right of blue: pays off under the evidence; overlap: depends on cost.

Illustrative application for the State Employment Service, employer internships and first jobs, and childcare with flexible work. Blue: share of participants who would need to gain additional employment for three years to cover the cost, from the low to the high cost. Pink: employment effects reported in evaluations in other contexts. The country office can replace both with Ukrainian costs and evidence in code/intervention_parameters.csv; the table for 1, 3 and 5 years is in the appendix.

Break-even applications by intervention, 1, 3 and 5 years

Intervention	Target group	Years	Cost per participant (UAH)	Needed, net earnings	Needed, plus receipts	Evidence range
Employment services (counselling and job matching)	All NEET young women	1	3,000 to 8,000	2% to 7%	2% to 4%	3% to 8%
Employment services (counselling and job matching)	All NEET young women	3	3,000 to 8,000	1% to 2%	1% to 1%	3% to 8%
Employment services (counselling and job matching)	All NEET young women	5	3,000 to 8,000	1% to 1%	0% to 1%	3% to 8%
Employer-supported internships and first jobs	All NEET young women	1	25,000 to 50,000	21% to 42%	13% to 26%	8% to 15%
Employer-supported internships and first jobs	All NEET young women	3	25,000 to 50,000	7% to 15%	5% to 9%	8% to 15%
Employer-supported internships and first jobs	All NEET young women	5	25,000 to 50,000	5% to 9%	3% to 6%	8% to 15%
Childcare services and flexible work	NEET young mothers	1	40,000 to 100,000	33% to 83%	21% to 52%	10% to 20%
Childcare services and flexible work	NEET young mothers	3	40,000 to 100,000	12% to 29%	7% to 18%	10% to 20%
Childcare services and flexible work	NEET young mothers	5	40,000 to 100,000	7% to 18%	5% to 11%	10% to 20%
Internships plus childcare (package)	NEET young mothers	1	65,000 to 150,000	54% to 125%	34% to 78%	20% to 30%
Internships plus childcare (package)	NEET young mothers	3	65,000 to 150,000	19% to 44%	12% to 27%	20% to 30%
Internships plus childcare (package)	NEET young mothers	5	65,000 to 150,000	12% to 27%	7% to 17%	20% to 30%

“Needed”: share of participants who must gain additional employment, sustained for the number of years shown, for benefits to equal the cost per participant (from the low to the high cost). “Evidence range”: employment effects reported in evaluations in other contexts. Central-scenario wage and fiscal rates, 5% discount.

6 · Recommendations by GenU priority

Priority 1: Learning-to-Earning pathway, First Experience and Earning Engine

Finding	Recommendation (strengthening existing mechanisms)	Who	Indication from the model
Employment at 18–24 is similar for women and men; the NEET gap mirrors lower education participation and the transition out of it	Keep young women in education and training to 18, and bridge the exit from education with first work experience (internships, apprenticeships, first-job support) through the State Employment Service and employers	Ministry of Economy and State Employment Service; employers; education and VET institutions; UNICEF (GenU)	Internships and first jobs: illustrative benefit-cost ratios above 1 in most assumptions; break-even at a few percentage points of additional employment
Women with vocational education show higher NEET than women with secondary or tertiary education; vocational women work in trade and services, men in construction, industry and transport	Review the match between vocational fields open to young women and employer demand; include non-traditional, better-paid fields in vocational guidance and employer partnerships	Ministry of Education and Science; VET institutions; employers; State Employment Service	Requires vacancy, pay and entry-requirement data by occupation (SSSU, SES dashboard)
Young women earn less than young men at every education level and the gap persists at comparable ages and areas; informality is lower for women	Pair first-job pathways with formal contracts and decent-work standards; use the gender pay gap by occupation as a monitoring indicator	Employers; State Labour Service; SES	Fiscal receipts depend on formality: each formal job adds about UAH 72,104 a year to the budget

Findings summarised from the preceding slides, to be confirmed against the final numbers; recommendations are for discussion and build on existing mechanisms rather than new programmes.

Priority 2: Inclusive Access and Navigation, linking protection and employment

Finding	Recommendation (strengthening existing mechanisms)	Who	Indication from the model
Motherhood and daily childcare show the clearest association with NEET in both surveys; poor young mothers make up a large share of NEET young women	Combine childcare access with flexible working arrangements and family-friendly workplace policies; prioritise young mothers in employment services	Ministry of Social Policy, Family and National Unity; local authorities; employers; UNICEF	Childcare and flexible work for young mothers: returns depend strongly on cost; combined with internships, break-even at about one in four participants in the illustrative range
Women in single-headed households and in the poorest households have higher NEET rates; children living with NEET young women are more often in poor households	Link social protection for single-headed households and low-income families with employment services (case management, referrals), so that benefits and job support reach the same young women	Ministry of Social Policy; State Employment Service; hromadas	Groups overlap: targeting through existing benefit registries reaches most poor young mothers
Displacement is not consistently associated with higher NEET; disability groups are too small to estimate	Keep inclusive outreach for displaced young women and young women with disabilities through existing IDP and disability services rather than separate programmes	Hromadas; IDP councils; UNICEF and partners	Not estimated: samples too small; track outcomes once programmes report

Findings summarised from the preceding slides, to be confirmed against the final numbers; recommendations are for discussion and build on existing mechanisms rather than new programmes.

For discussion

Targeting: poor young mothers and women in single-headed households are the clearest groups; inclusive outreach where the surveys cannot estimate precisely.

Scenarios: pessimistic, central and optimistic values depend on assumed earnings, employment gains and formality; national scaling additionally requires a 2026 population estimate.

Proposed next step: agree priority groups and two or three intervention packages under the two GenU priorities, replace the illustrative costs in code/intervention_parameters.csv with real costs, and identify the employer-demand data needed to complete the investment case.

Appendix

Assumptions behind the cost of inaction and the intervention comparison

Element	Assumption	Source or note
Population at risk	NEET women aged 18–24 (30.8% in MICS 2025/26); results per 1,000 NEET young women	National scaling needs a 2026 count of women aged 18–24 (COI$pop_w1824)
Potential earnings	Net monthly wage of employed women aged 18–24: UAH 7,000 (25th percentile), 10,000 (median), 15,000 (75th percentile)	HSESS 2023/24, nominal UAH, Dec 2023 to Feb 2024 prices; no real wage growth
Share who could work	10% (pessimistic), closing the gap with young men (44%, central), 50% (optimistic)	HSESS gap between women's and men's NEET at 18–24
Formality	60%, 80%, 100% of the additional employment pays taxes and contributions	Scenario assumption
Government receipts	18% income tax and 5% levy on gross wages; 22% employer social contribution; 20% VAT on 80% of net earnings	Statutory rates, to confirm
Duration and discounting	3 years at 7%; 5 years at 5%; 10 years at 3%; lifetime to age 60 at 5%	A Brighter Future (2024) for the central rate
Interventions	Cost per participant (present value of total cost, including recurring support) and additional employment effects, low and high	code/intervention_parameters.csv, illustrative; to be replaced with country office costs
Not included	Employer returns; women's work-related expenses; effects on other household members; general-equilibrium effects	Subsequent analysis

How the intervention parameters are built and updated

Step	What was done	How the country office can update it
1. Intervention types	Four types from the GenU priorities: employment services (counselling and job matching), employer-supported internships and first jobs, childcare services with flexible work, and a combined package for young mothers	Add rows to code/intervention_parameters.csv (one per intervention or package), with a target group
2. Costs	Present value of the total cost per participant over the support period, low and high; illustrative placeholders	Replace with SES, partner and UNICEF unit costs, including recurring childcare or transport support
3. Employment effects	Additional, sustained employment attributable to the intervention, low and high, from evaluations in other contexts (meta-analyses of active labour market programmes and youth employment, and studies of childcare support), as in A Brighter Future	Replace with Ukrainian evaluations where available (for example SES programme follow-up data)
4. Benefits	Effect multiplied by the annual value of a job (net earnings; income tax, levy, contributions and VAT) over the years sustained, discounted at 5%	Change wage, formality or duration in 04_cost_of_inaction.R to test scenarios
5. Outputs	Benefit-cost ratios by perspective, break-even employment gains, and the comparison with the evidence range	Re-run bash UPDATE_RESULTS.sh; all slides update

Employer returns (productivity, retention, vacancy costs) are not included and would be the next step for the private sector case.

Age groups

Age group	Indicators	Notes
15–17	Education, training, NEET	Younger group; ages 14–17 are legal minors. HSESS asks employment questions from age 15; school attendance is available from age 3 in MICS and HSESS rosters
18–24	Labour-force participation, employment, job quality, earnings, NEET, cost of inaction	Main group, in line with government statistics and UNICEF programming
15–24	Education-to-work transition, NEET	UNICEF programme age range
15–29	NEET	ILO age range for NEET, shown for reference

MICS 2025/26 asks the NEET and employment questions to women aged 15–24 only; school attendance is recorded for all household members aged 3–24. HSESS 2023/24 covers women and men. The LFS 2021 public file releases age in bands, so it is shown for 15–24 only.

Variables and definitions (1/2)

Concept	Definition	MICS 2025/26	HSESS 2023/24	LFS 2021
In education	Attending school or university in the current school year	ED9 (members 3–24); NE3 (women 15–24)	IND_A9	reason_inactiv = 2 (inactive students)
Employed	Worked at least one hour for pay or profit in the reference week, or temporarily absent; production for own household use only is not counted	NE8–NE11, NE20–NE21 (women 15–24)	IND_B1	labour_force = 1
NEET	Not in education or training and not employed	NEET module (women 15–24)	IND_A9, IND_B1	labour_force, reason_inactiv (upper bound)
Labour-force participation	Employed, or looking for work or starting a business	not available	IND_B1, IND_B21	labour_force 1–2
Informal employment	Verbal agreement, unregistered own-account work, or family farm work for sale	not available	IND_B3_1	informal_empl = 1
Mother	Has given birth (MICS) or lives with own child under 18 (HSESS)	CEB	household roster (IND_A1, ages)	not available

Variables and definitions (2/2)

Concept	Definition	MICS 2025/26	HSESS 2023/24	LFS 2021
Care work	Caring for children or the sick in the past week (5–17); daily care of own children	CL11E, CL11F	IND_B28_1	reason_inactiv = 3 (proxy)
Internally displaced	Self-reported IDP status	WB10A	IND_A19	not available
Disability	Washington Group functional difficulty (18–49); any household member with disability	AF module	D1_Mult3/4	not available
Economic status	Wealth quintile; household income per member	windex5	V1 / household size	not available
Years of education	Years implied by the highest level completed (9 basic secondary, 11 complete secondary, 12 vocational, 13 short-cycle, 15 bachelor, 17 master)	welevel	IND_A7	education

Key variables (1/2)

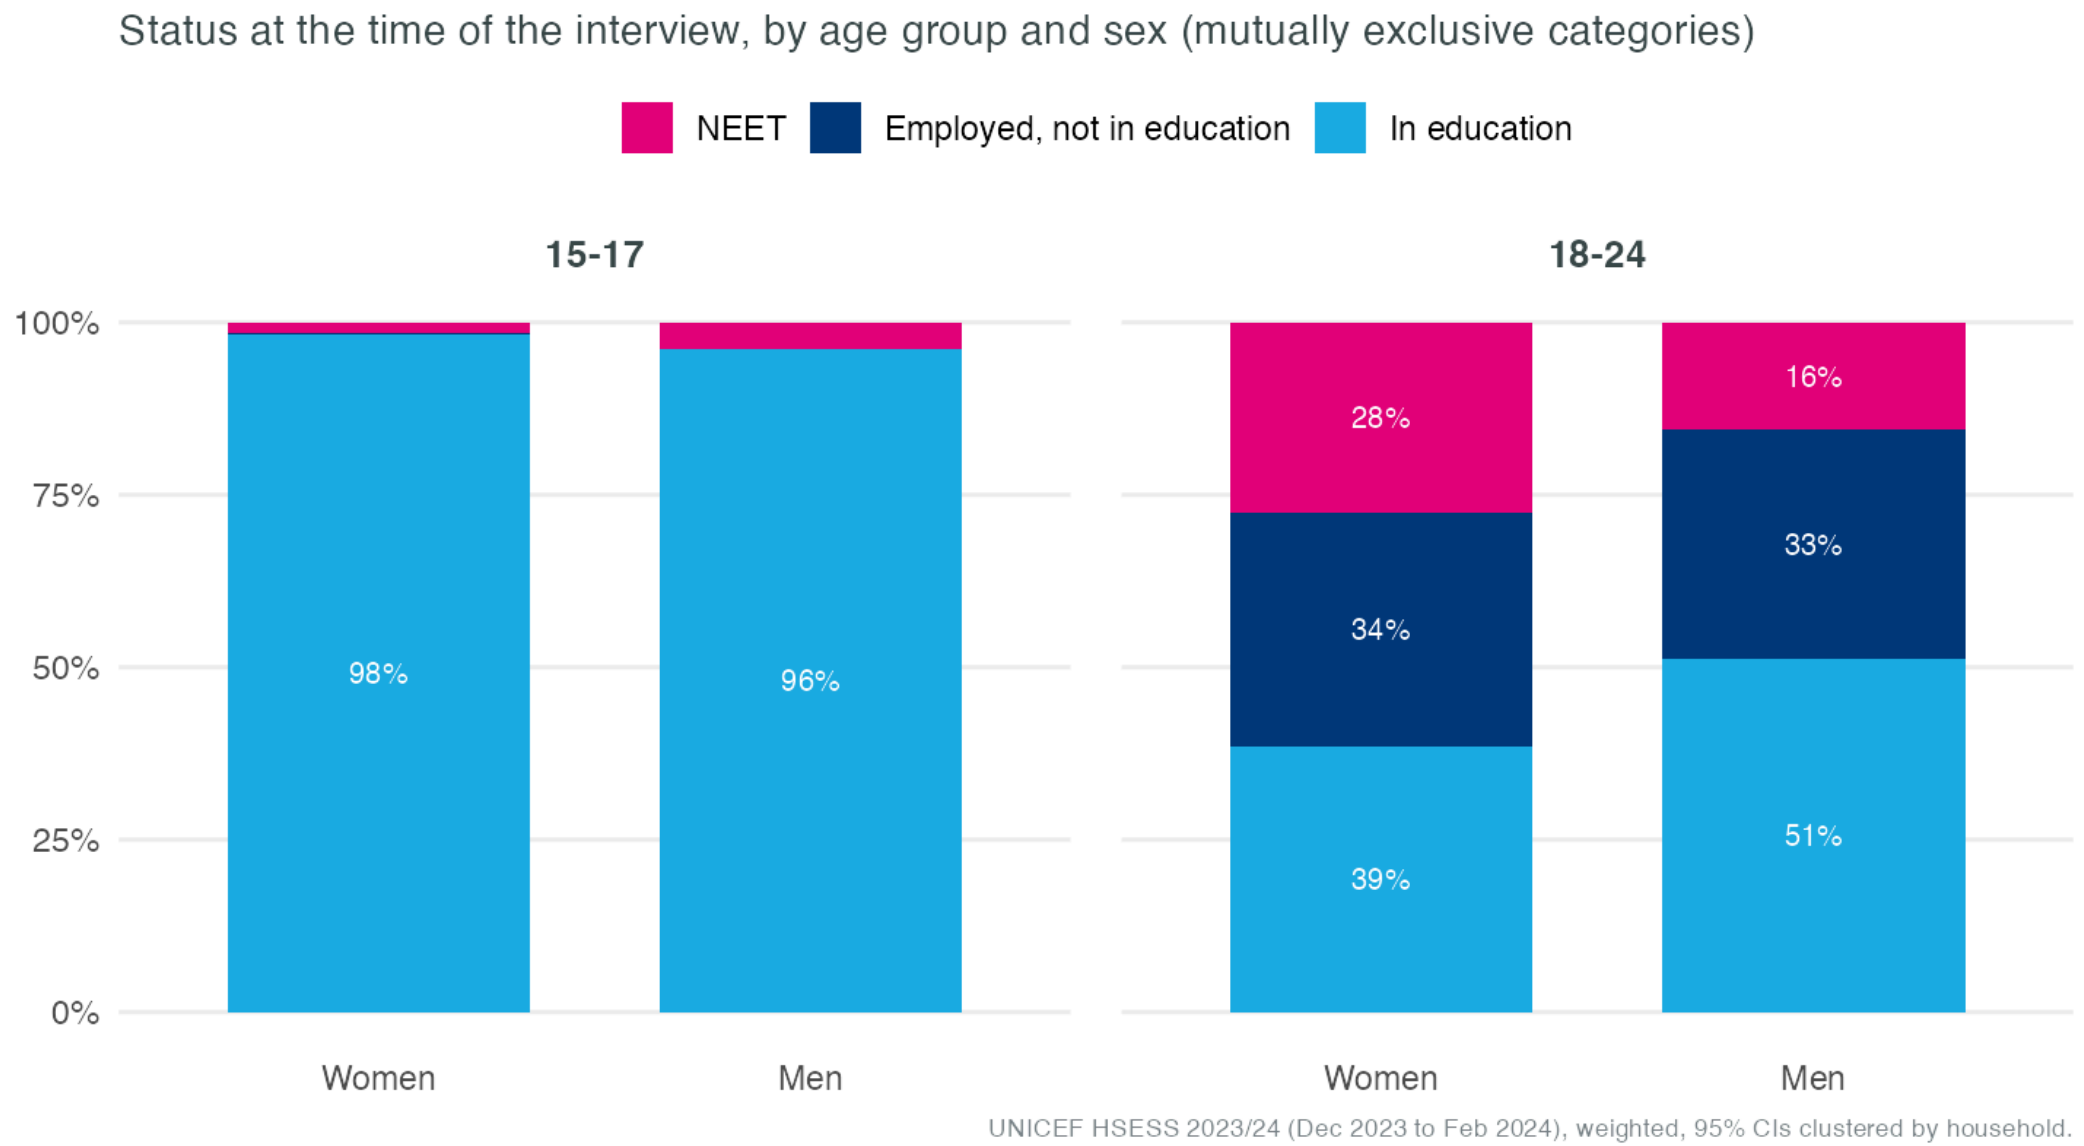

Concept	Use	MICS 2025/26	HSESS 2023/24	LFS 2021
Age	Groups 15-17, 18-24; 15-29 for NEET	HL6; WB4 (women)	IND_A2 age in years	age_gr (bands)
Sex	Breakdown by sex	HL4 (household members)	IND_A3	sex
Survey design	Weighted estimates	hhweight, wmweight, fsweight; psu; stratum	Final weight; household key	weight_year; kod_res
Region / area	Regional and urban/rural breakdown	HH7 oblast; macroregion; HH6	OBLAST; SETTL_TYPE	rg; tp_ar
Displacement	Breakdown by displacement	WB10A IDP status; PE3 household moved	IND_A19 IDP status	not available
Disability	Breakdown by disability	disability (functioning, 18-49)	D1_Mult3/4 household member	not available
Marital status	Household formation	MSTATUS	IND_A6	marital_st
Motherhood	Breakdown by motherhood	CEB children ever born; WDOBFC	Own child under 18 (roster)	not available
Care work	Care responsibilities	CL11E/F caring for children or the sick (5-17)	IND_B28_1 daily care of own children	reason_inactiv = 3 (proxy)
Childcare access	Preschool attendance	ED9, ED10A (ages 3-5)	IND_A14 reason not attending	not available
Economic status	Breakdown by income or wealth	windex5 wealth quintile; PE20 income	V1 household income per member	not available

Key variables (2/2)

Concept	Use	MICS 2025/26	HSESS 2023/24	LFS 2021
Changes since 2022	Household context	PE3 moved; PE5 dwelling damaged; PE12 members separated	not available	not applicable
Education level	Education-to-work transition	welevel; ED10A level attended	IND_A7	education; special_dipl
In education	School attendance, NEET	ED9 (members 3-24); NE3 (women 15-24)	IND_A9; IND_A10 type	reason_inactiv = 2
Training	NEET	NE6 courses or training (women 15-24)	not available	not available
Employment	Employment, NEET	NE8-NE11, NE20-NE21 (women 15-24)	IND_B1	labour_force
Job search	Unemployment, participation	not available	IND_B21	labour_force = 2
Reason not working	Reasons for inactivity	not available	IND_B24	reason_inactiv
Occupation / sector	Occupational distribution	not available	IND_B6_2; IND_B5_2	occupation
Job quality	Informality, hours	not available	IND_B3_1; IND_B9_1; IND_B10_1	informal_empl; actual_duration
Earnings	Wage differences, costing	not available	IND_V1_1_1 (wages)	not available

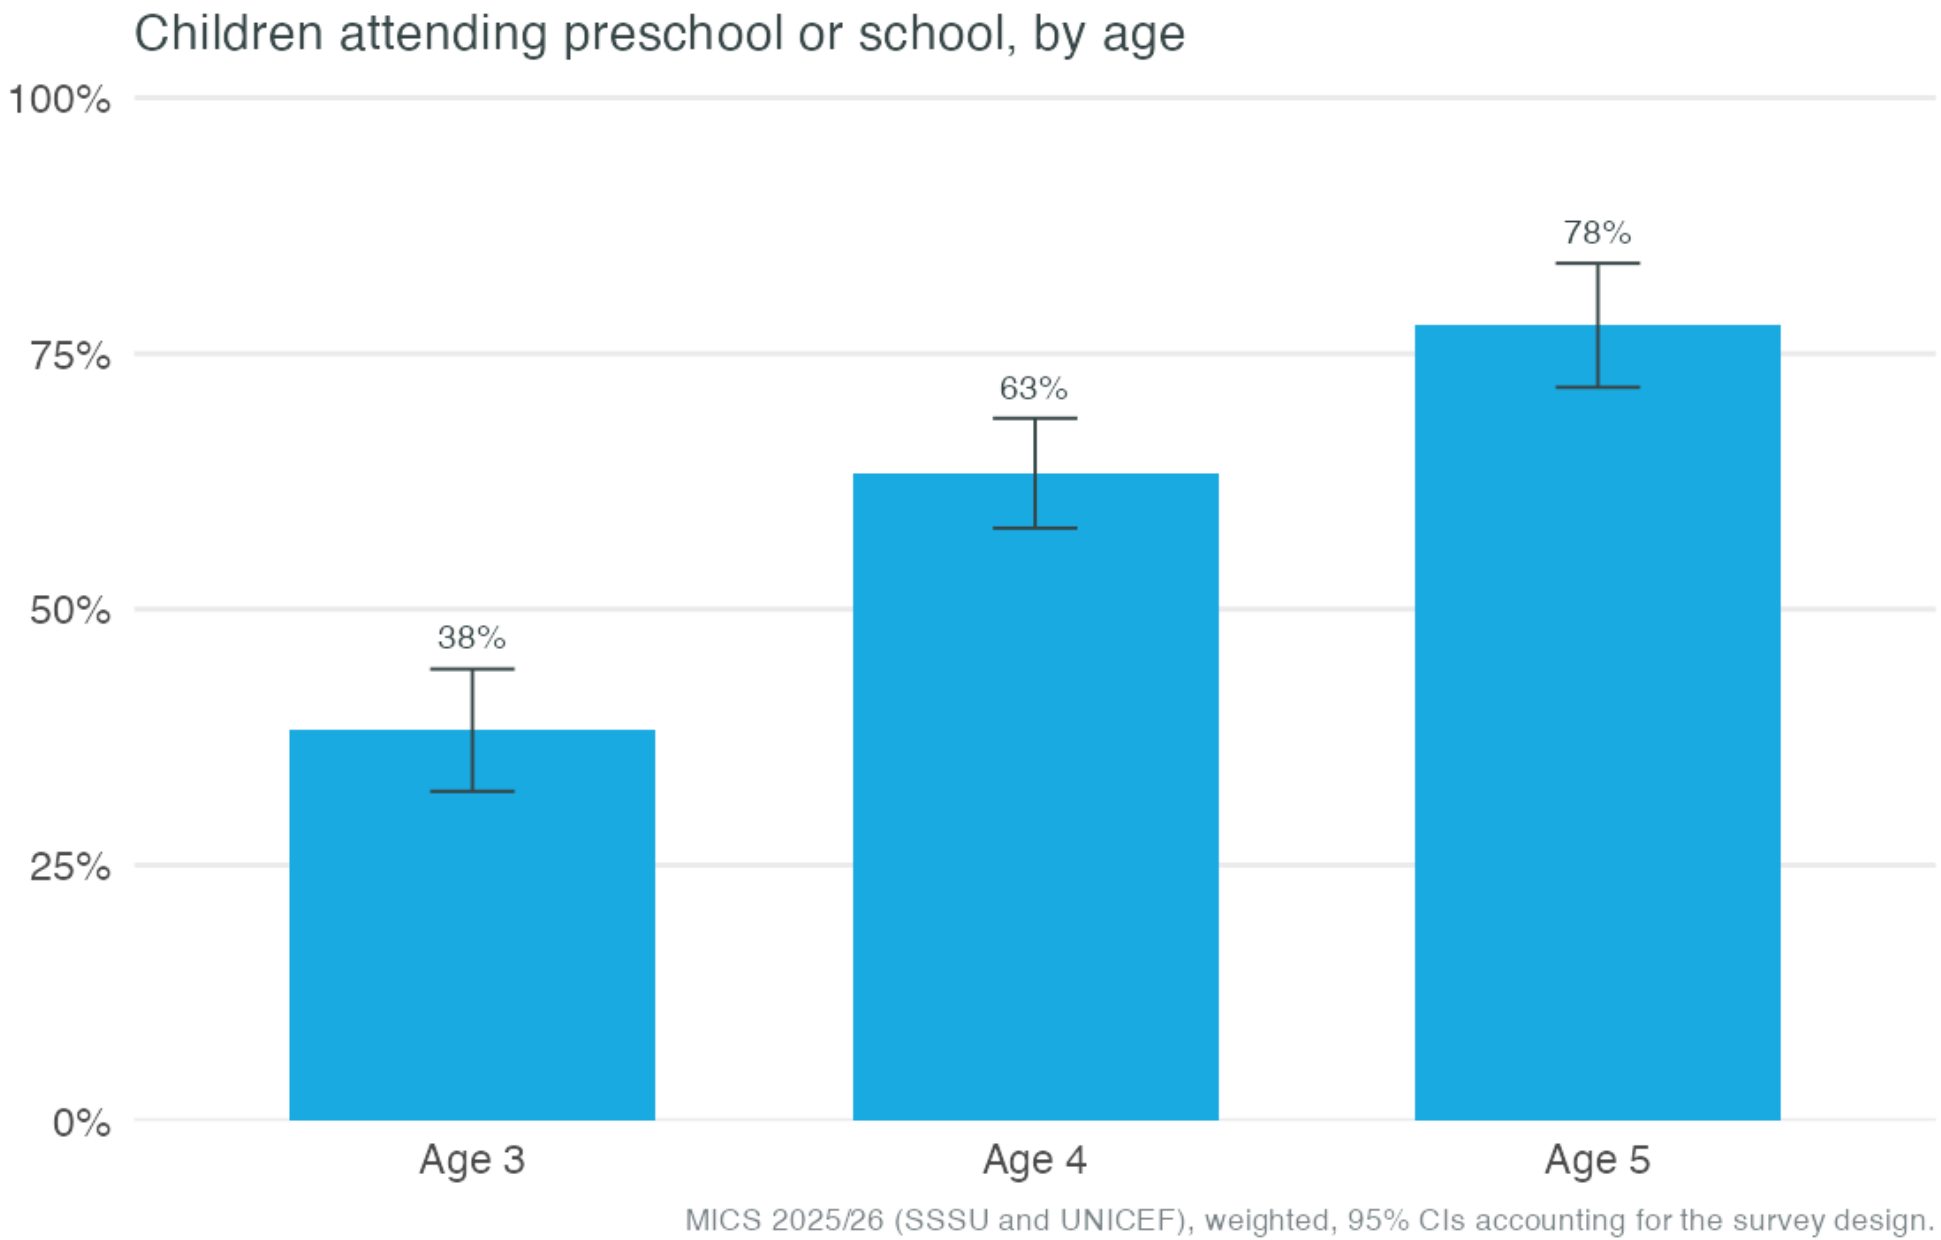

Variable codes as in each questionnaire. Full list of variables in every file: output/inventory/variable_report.xlsx.

Status at 15–17 and 18–24 by sex, stacked view (HSESS 2023/24)

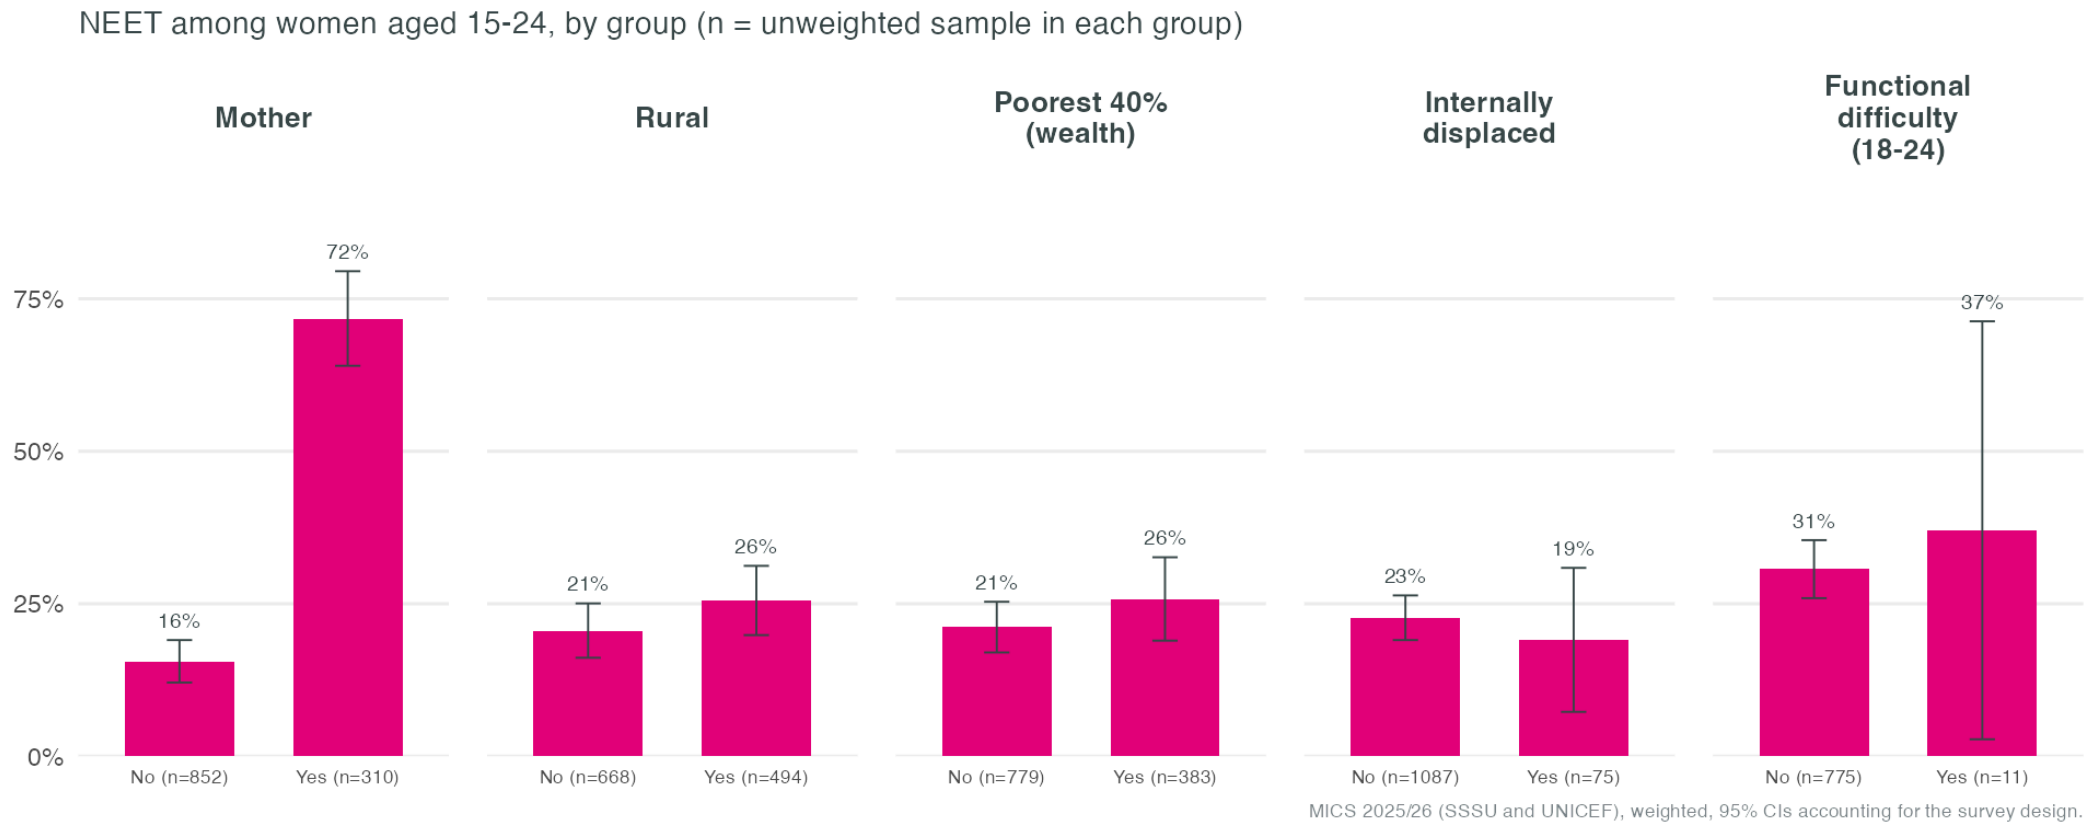

UNICEF HSESS 2023/24 (Dec 2023 to Feb 2024), weighted, 95% CIs clustered by household.

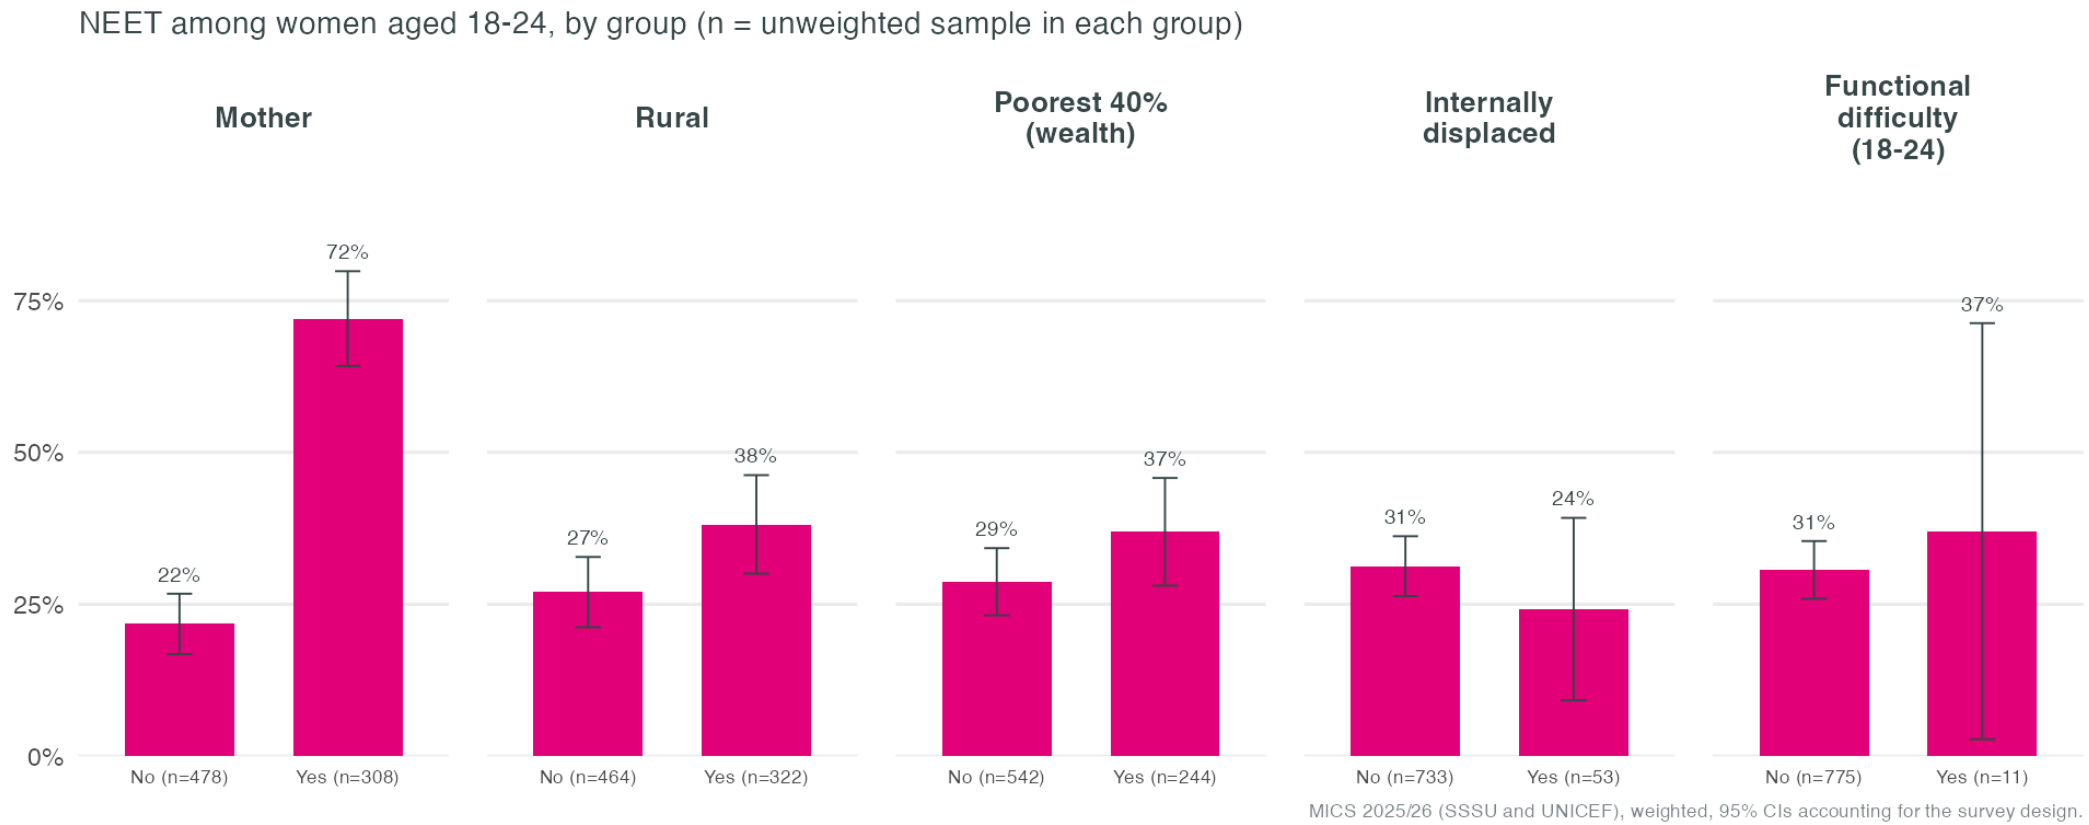

Preschool attendance by single year of age (MICS 2025/26)

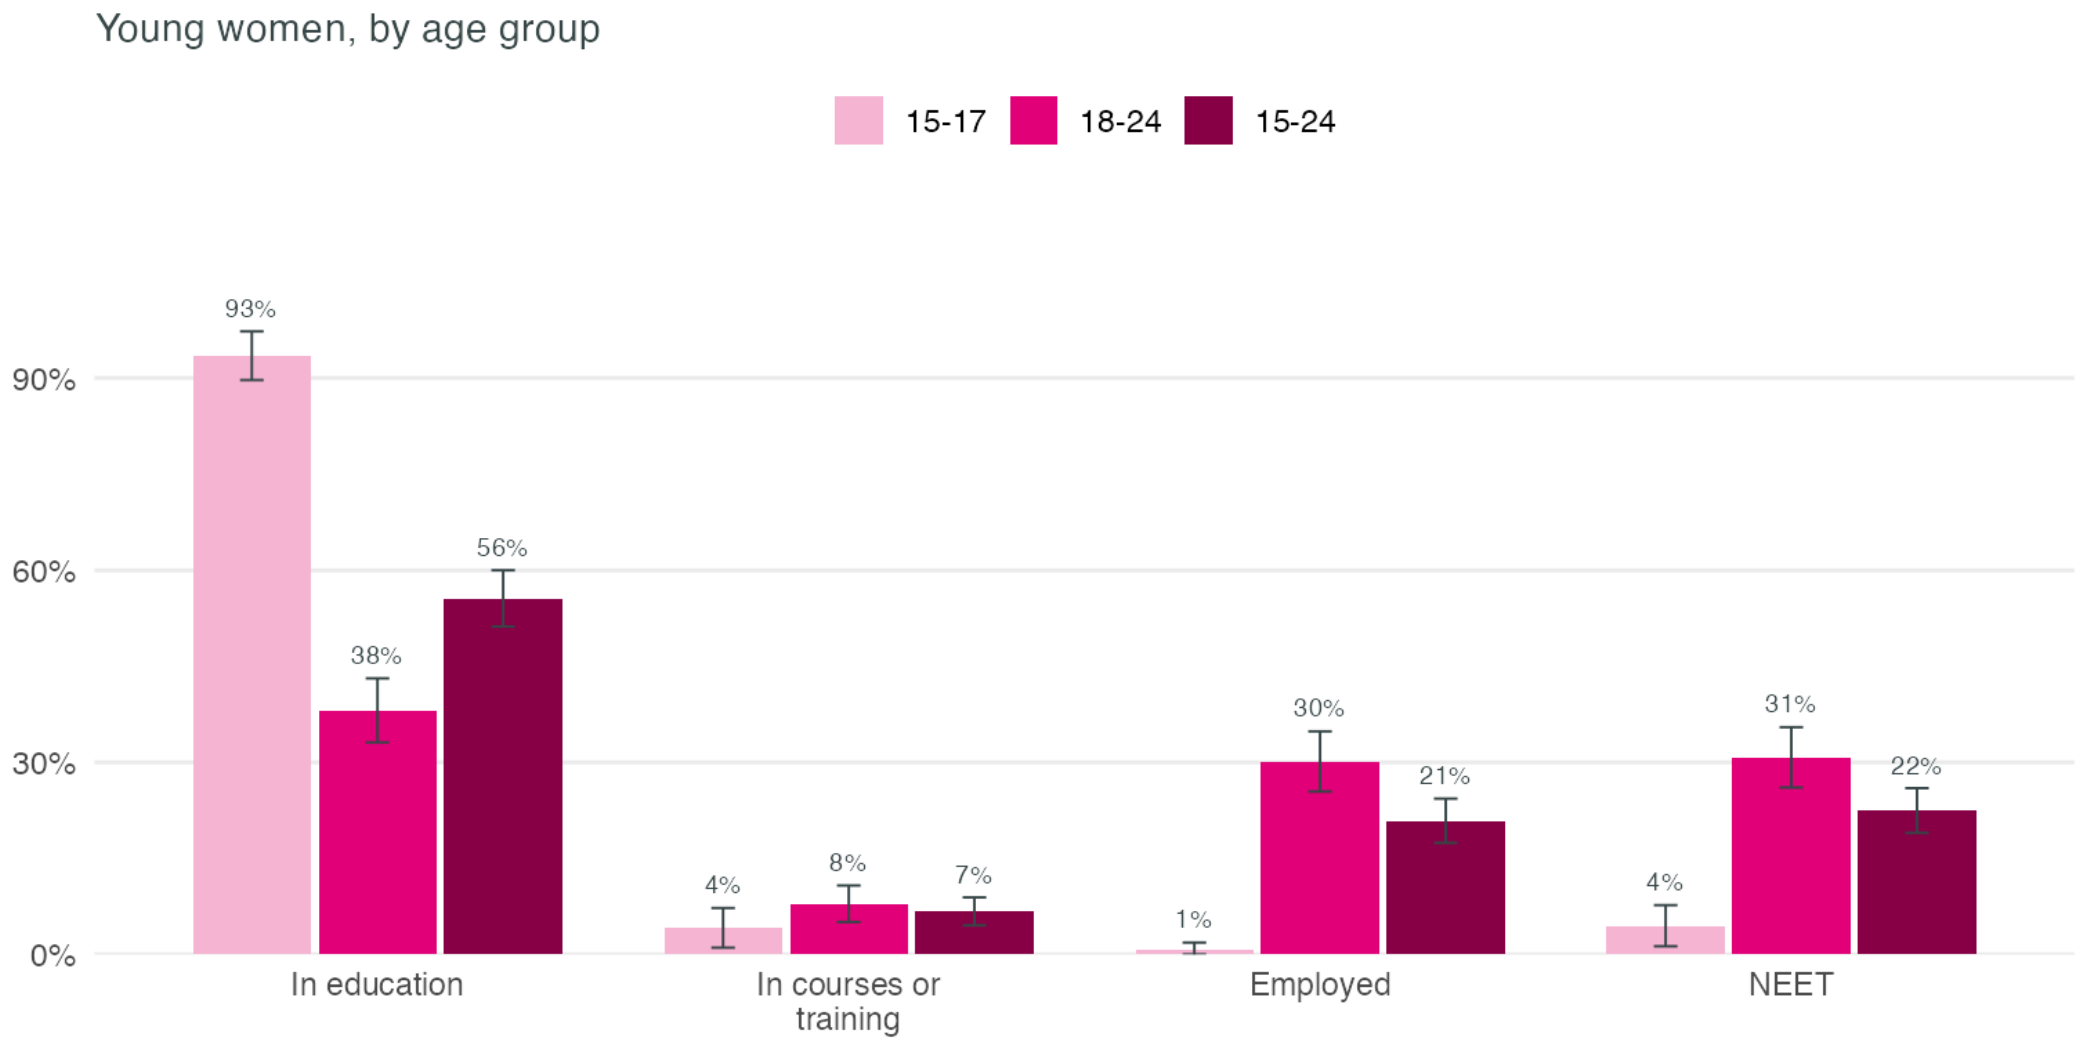

NEET among women aged 15–24 by motherhood, area, wealth, displacement and disability (MICS 2025/26)

Sensitivity: the same groups among women aged 18–24 (MICS 2025/26)

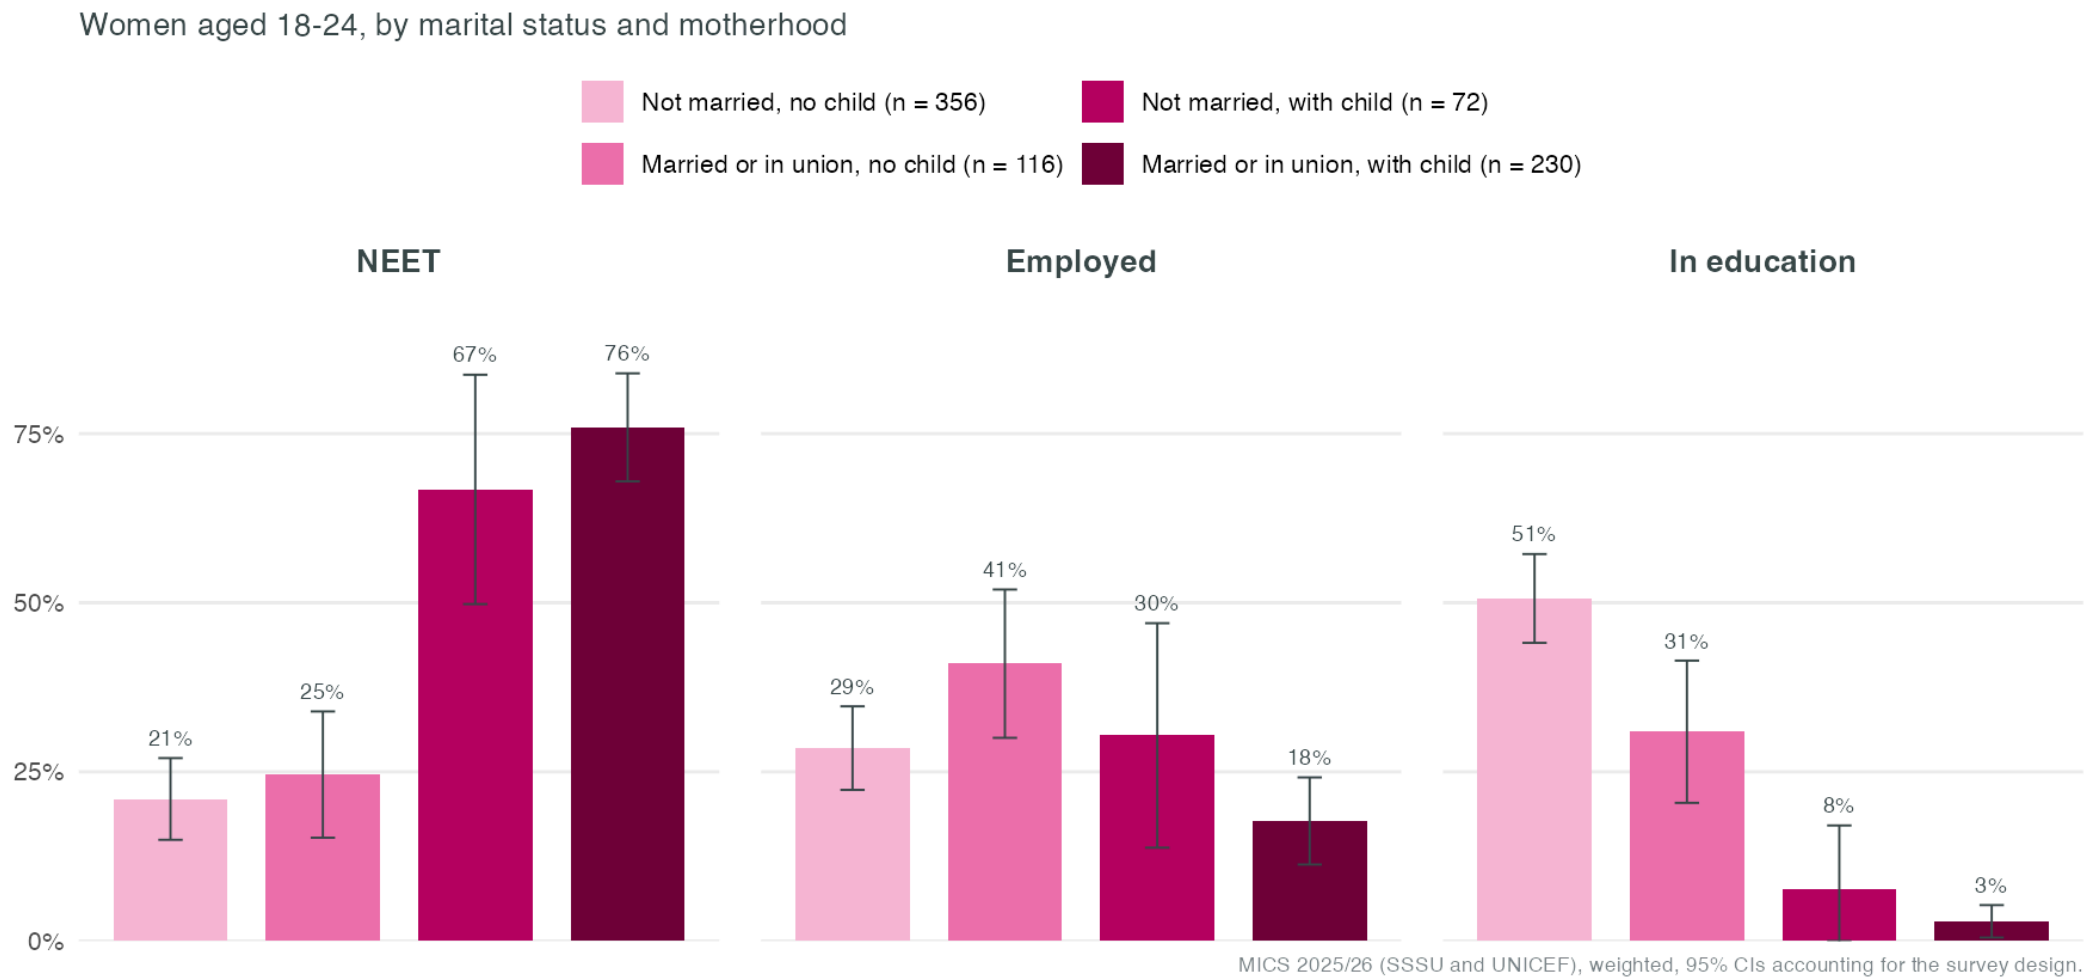

Young women by age group: education, training, employment and NEET (MICS 2025/26)

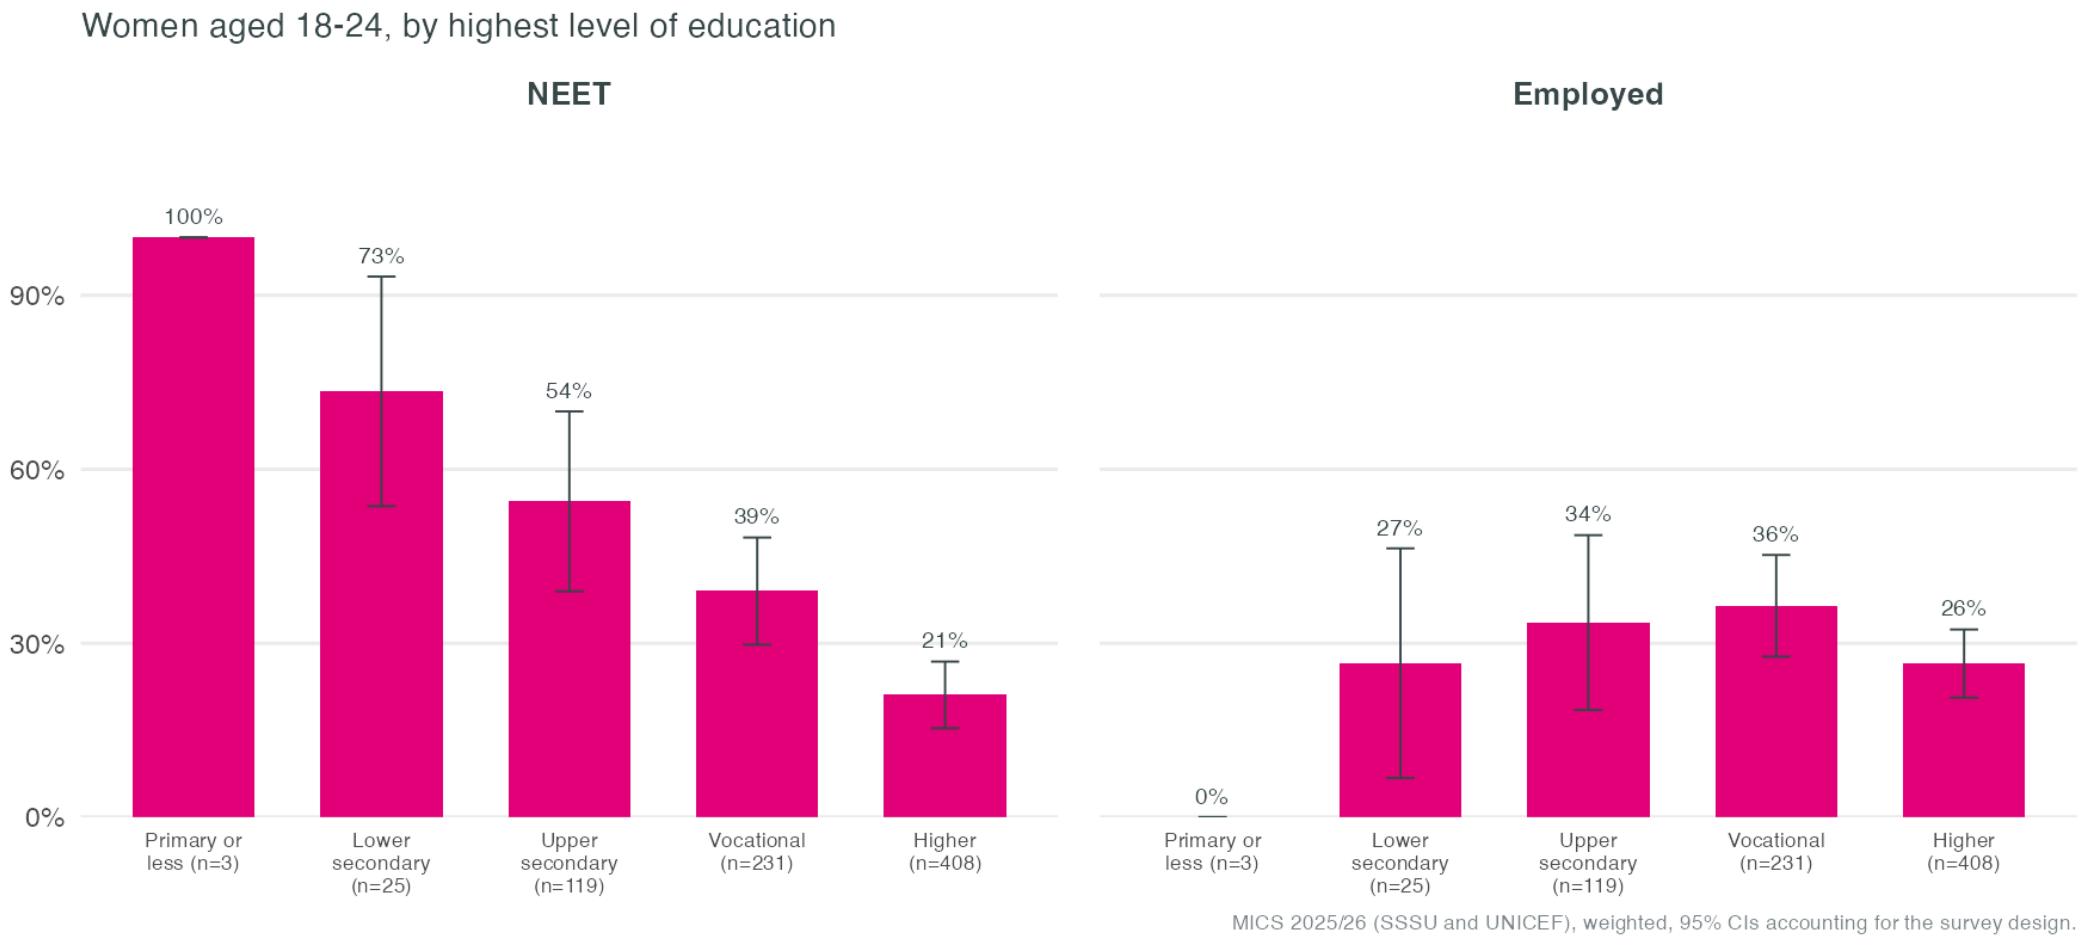

MICS 2025/26 (SSSU and UNICEF), weighted, 95% CIs accounting for the survey design.

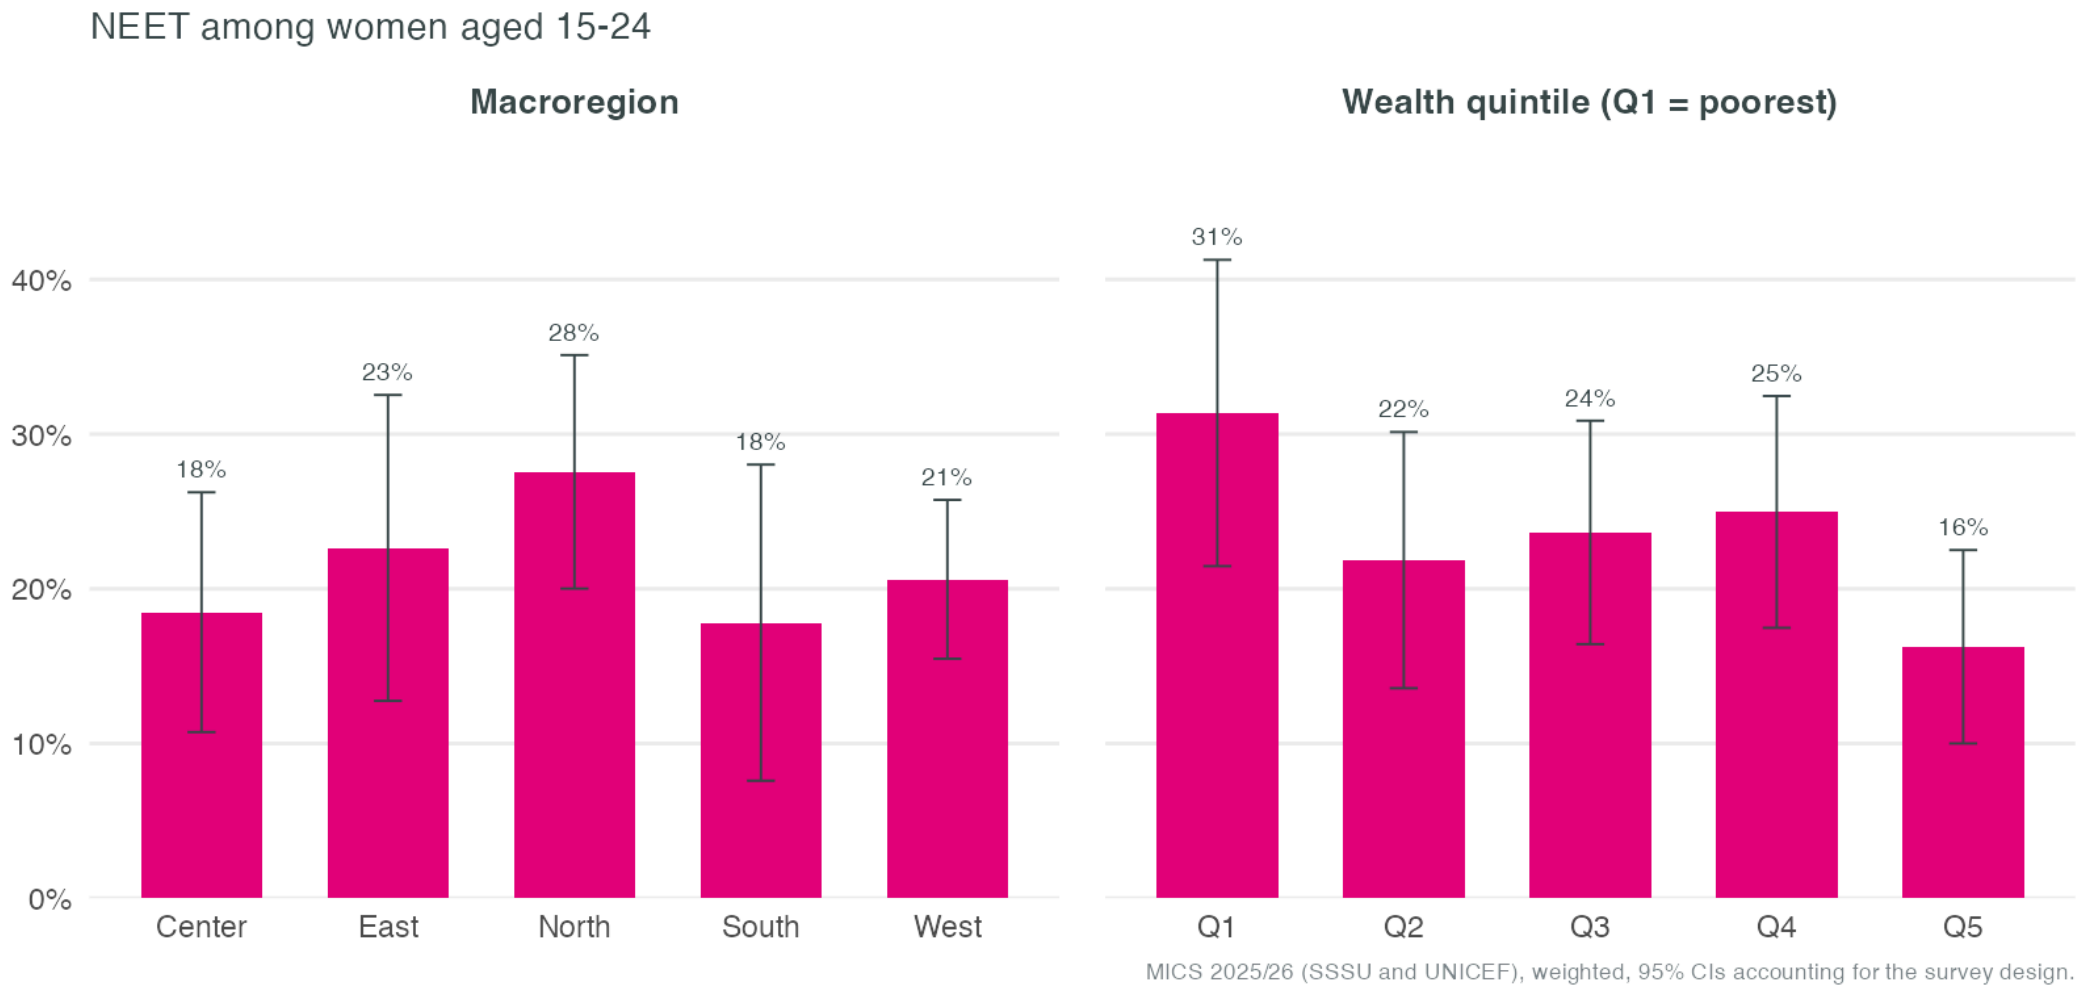

Women 18–24 by marital status and motherhood (MICS 2025/26)

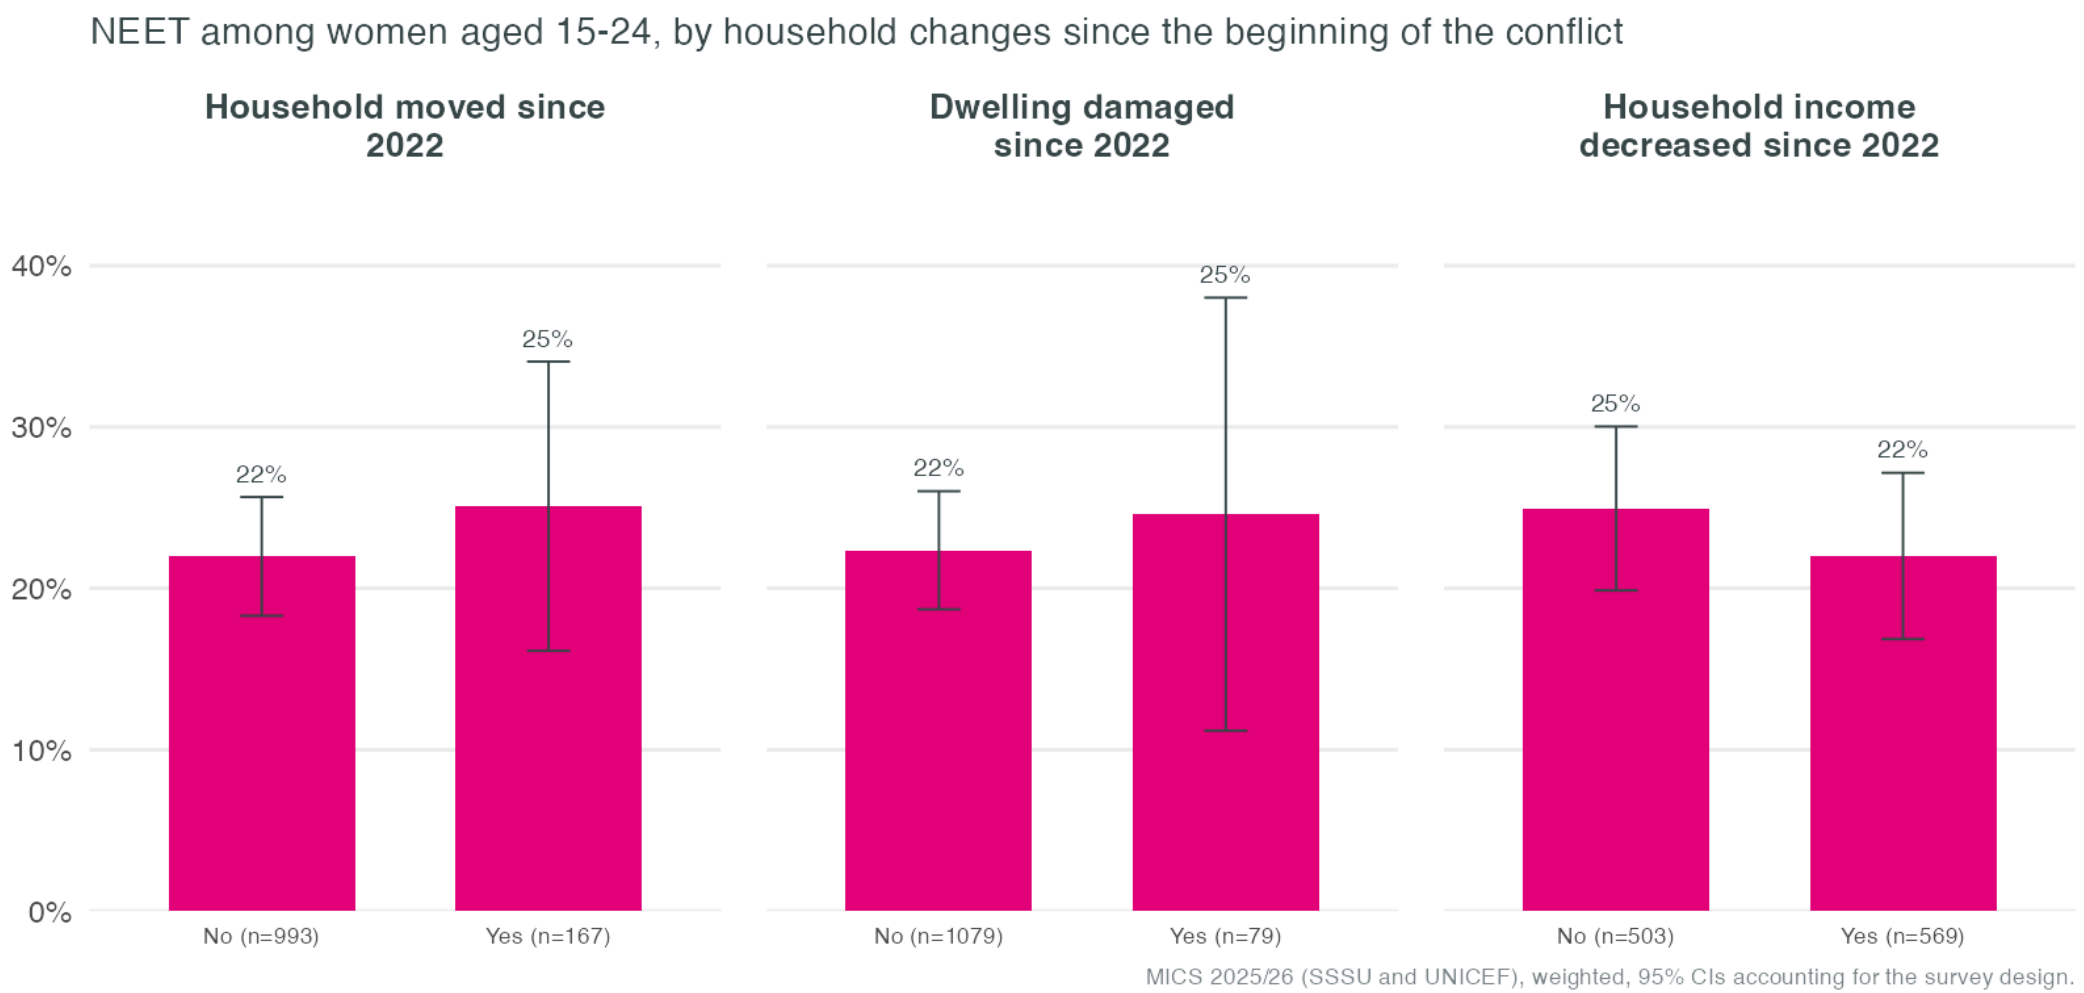

NEET and employment among women 18–24 by level of education (MICS 2025/26)

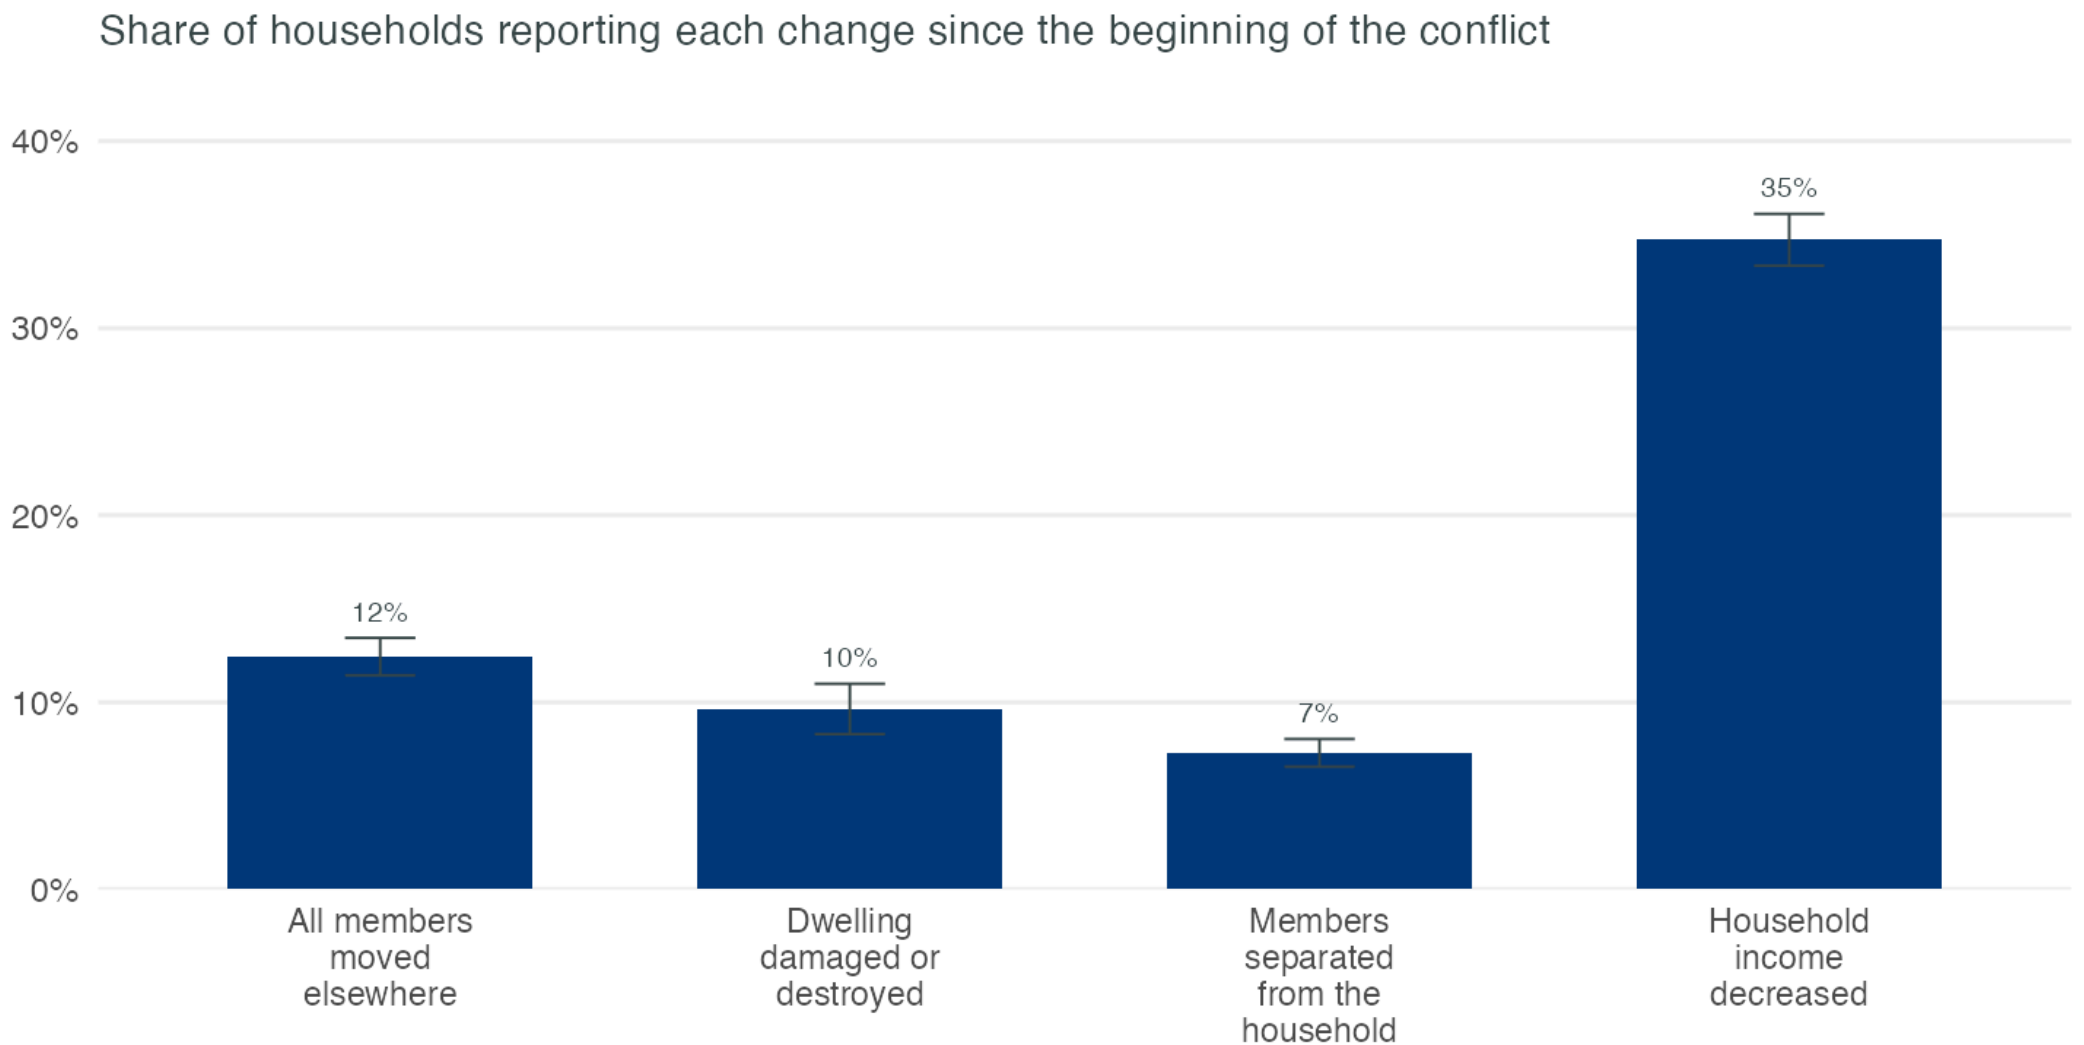

NEET among women 15–24 by macroregion and wealth quintile (MICS 2025/26)

NEET among women 15–24 by household changes since the beginning of the conflict (MICS 2025/26)

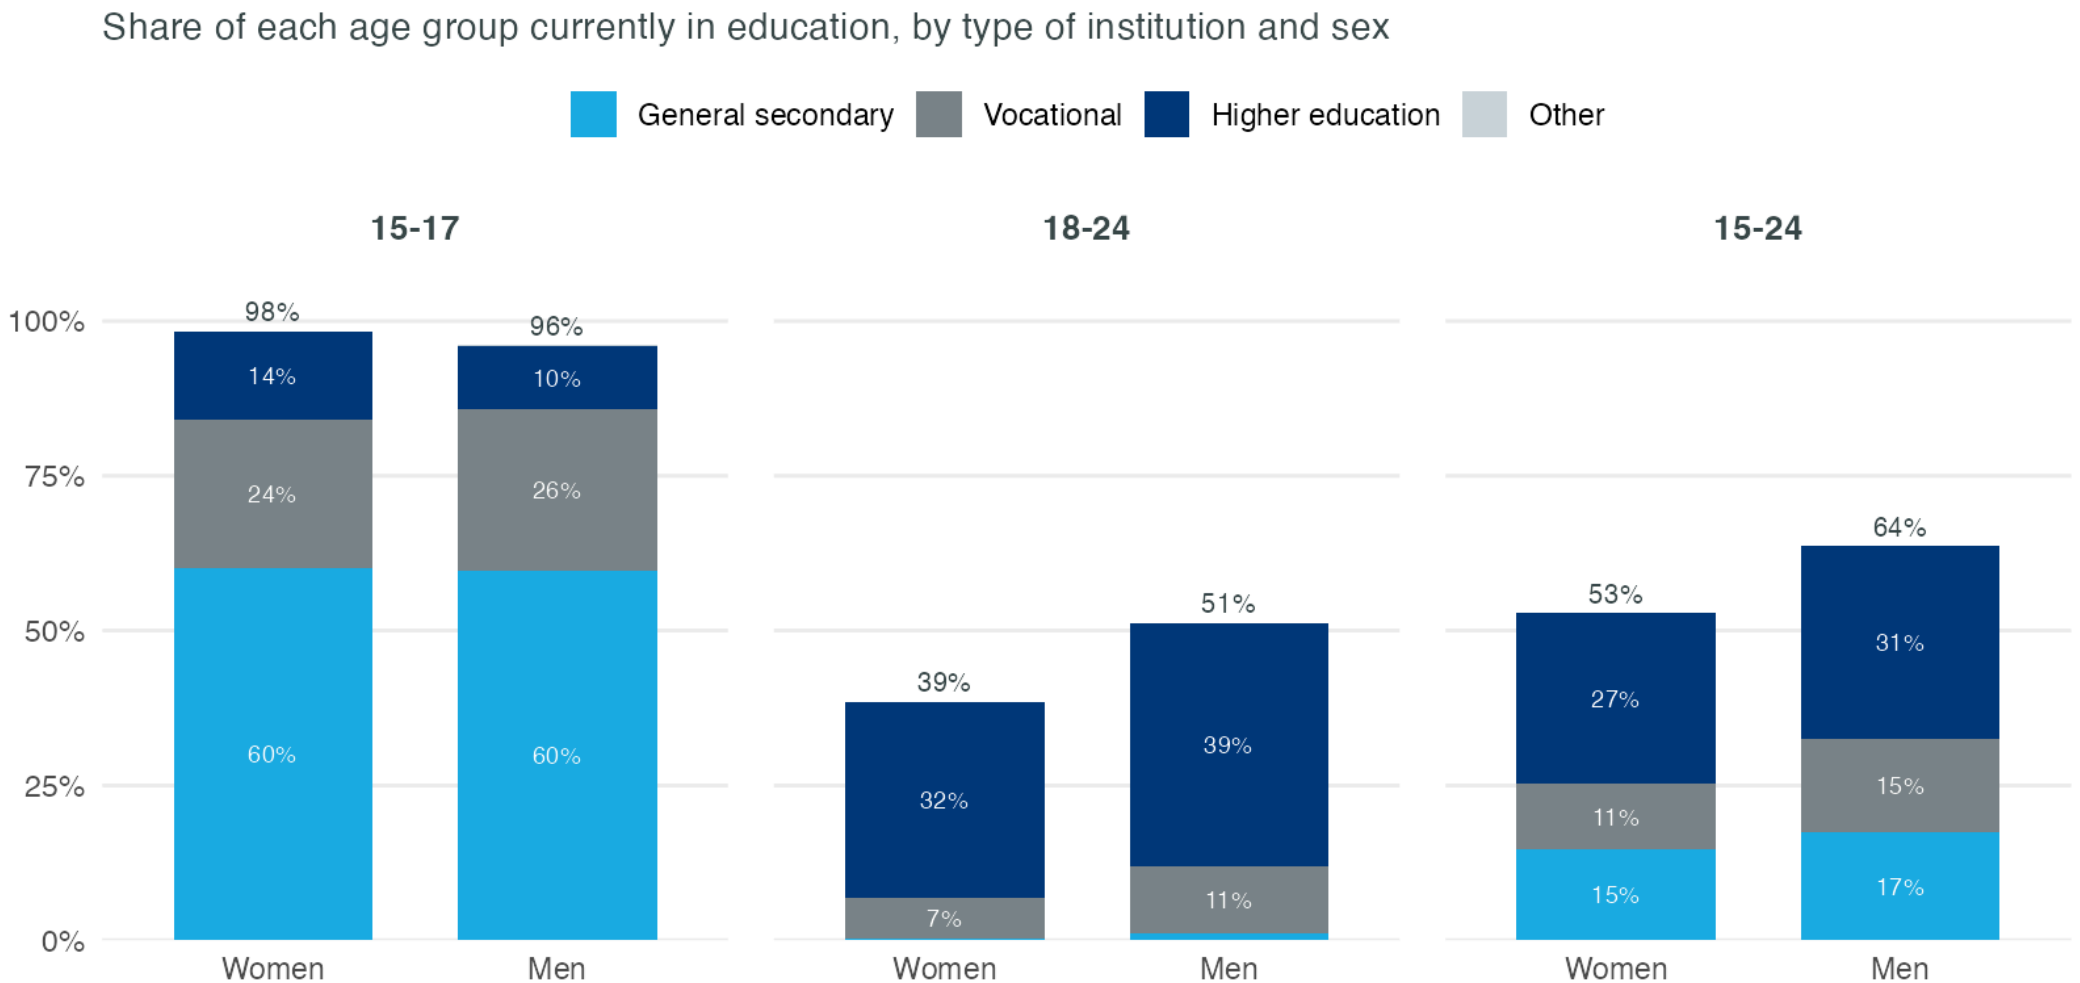

Households since the beginning of the conflict: 12% moved and 35% report lower income (MICS 2025/26)

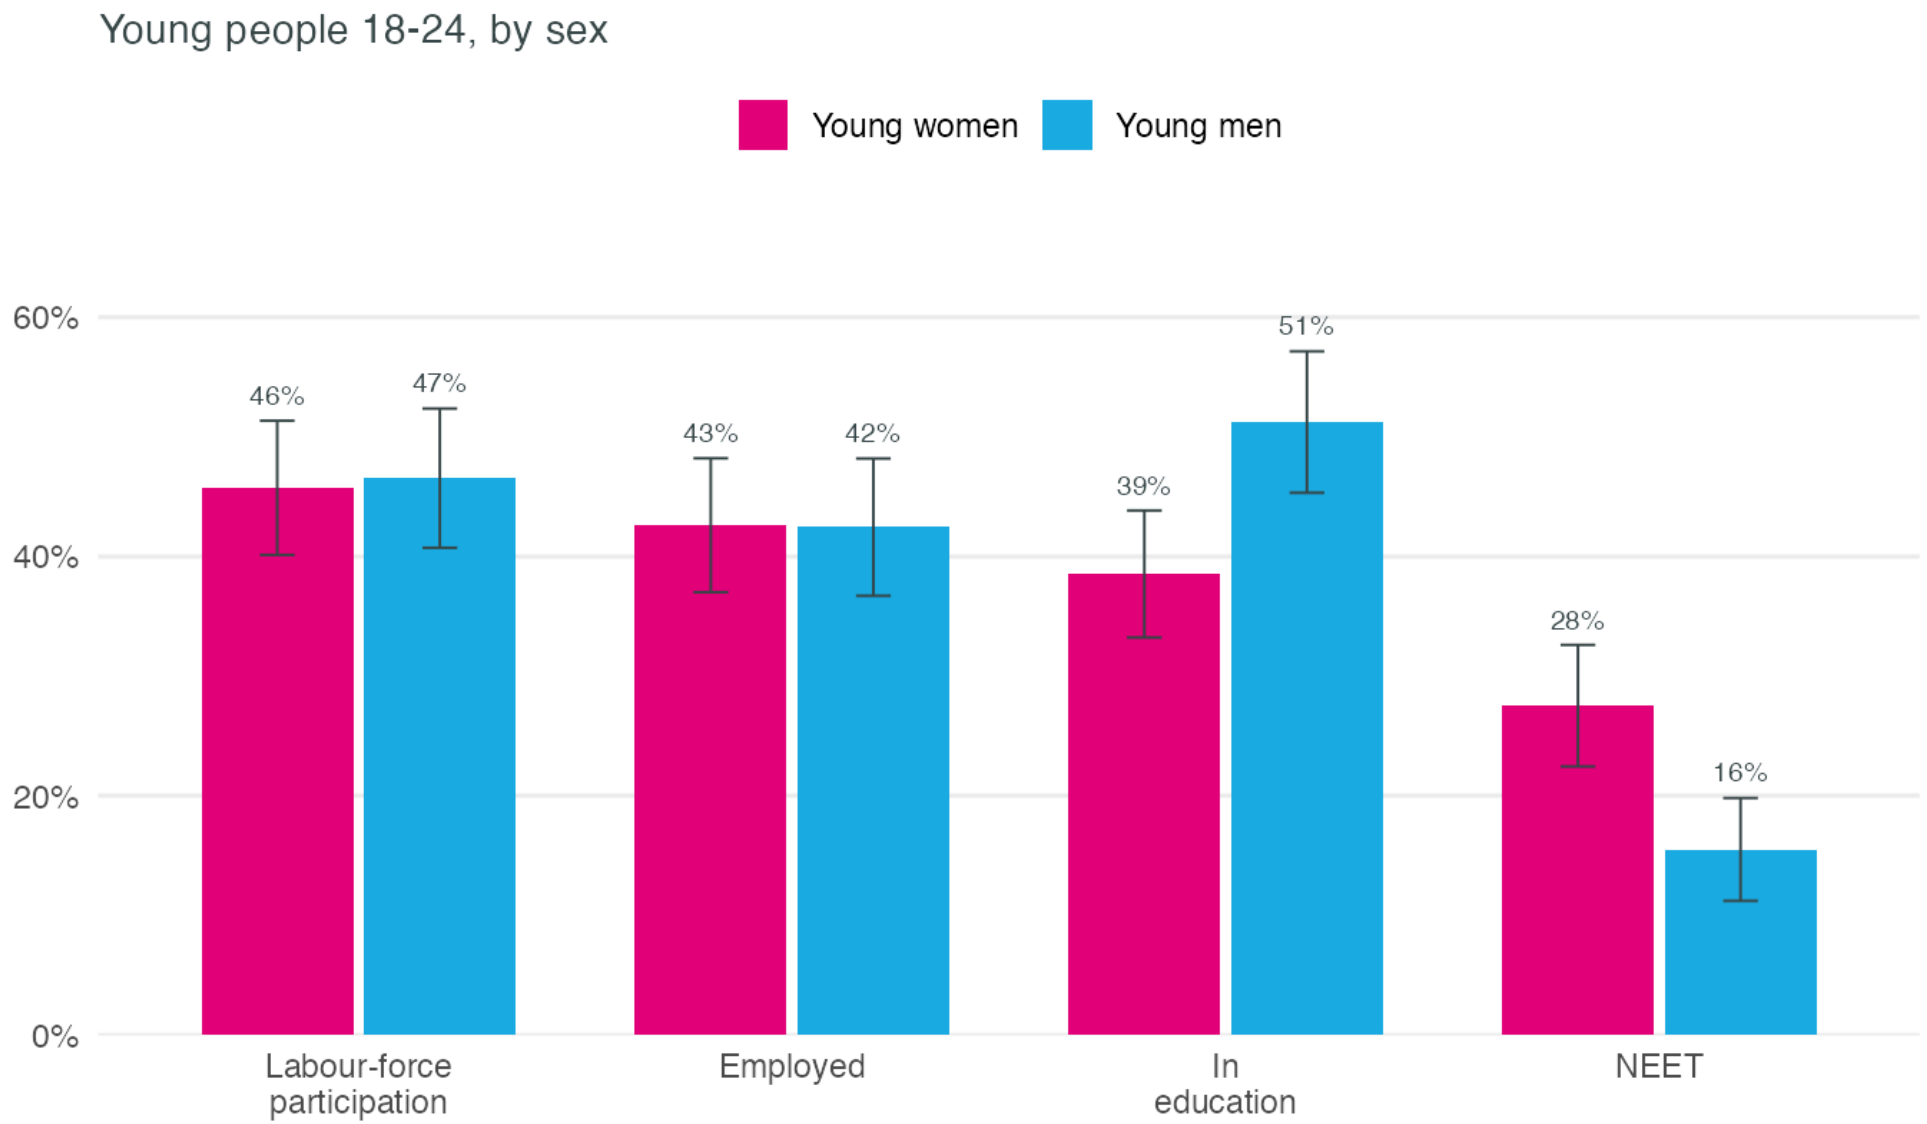

MICS 2025/26 (SSSU and UNICEF), weighted, 95% CIs accounting for the survey design.

In education at 15–24 by type of institution (HSESS 2023/24)

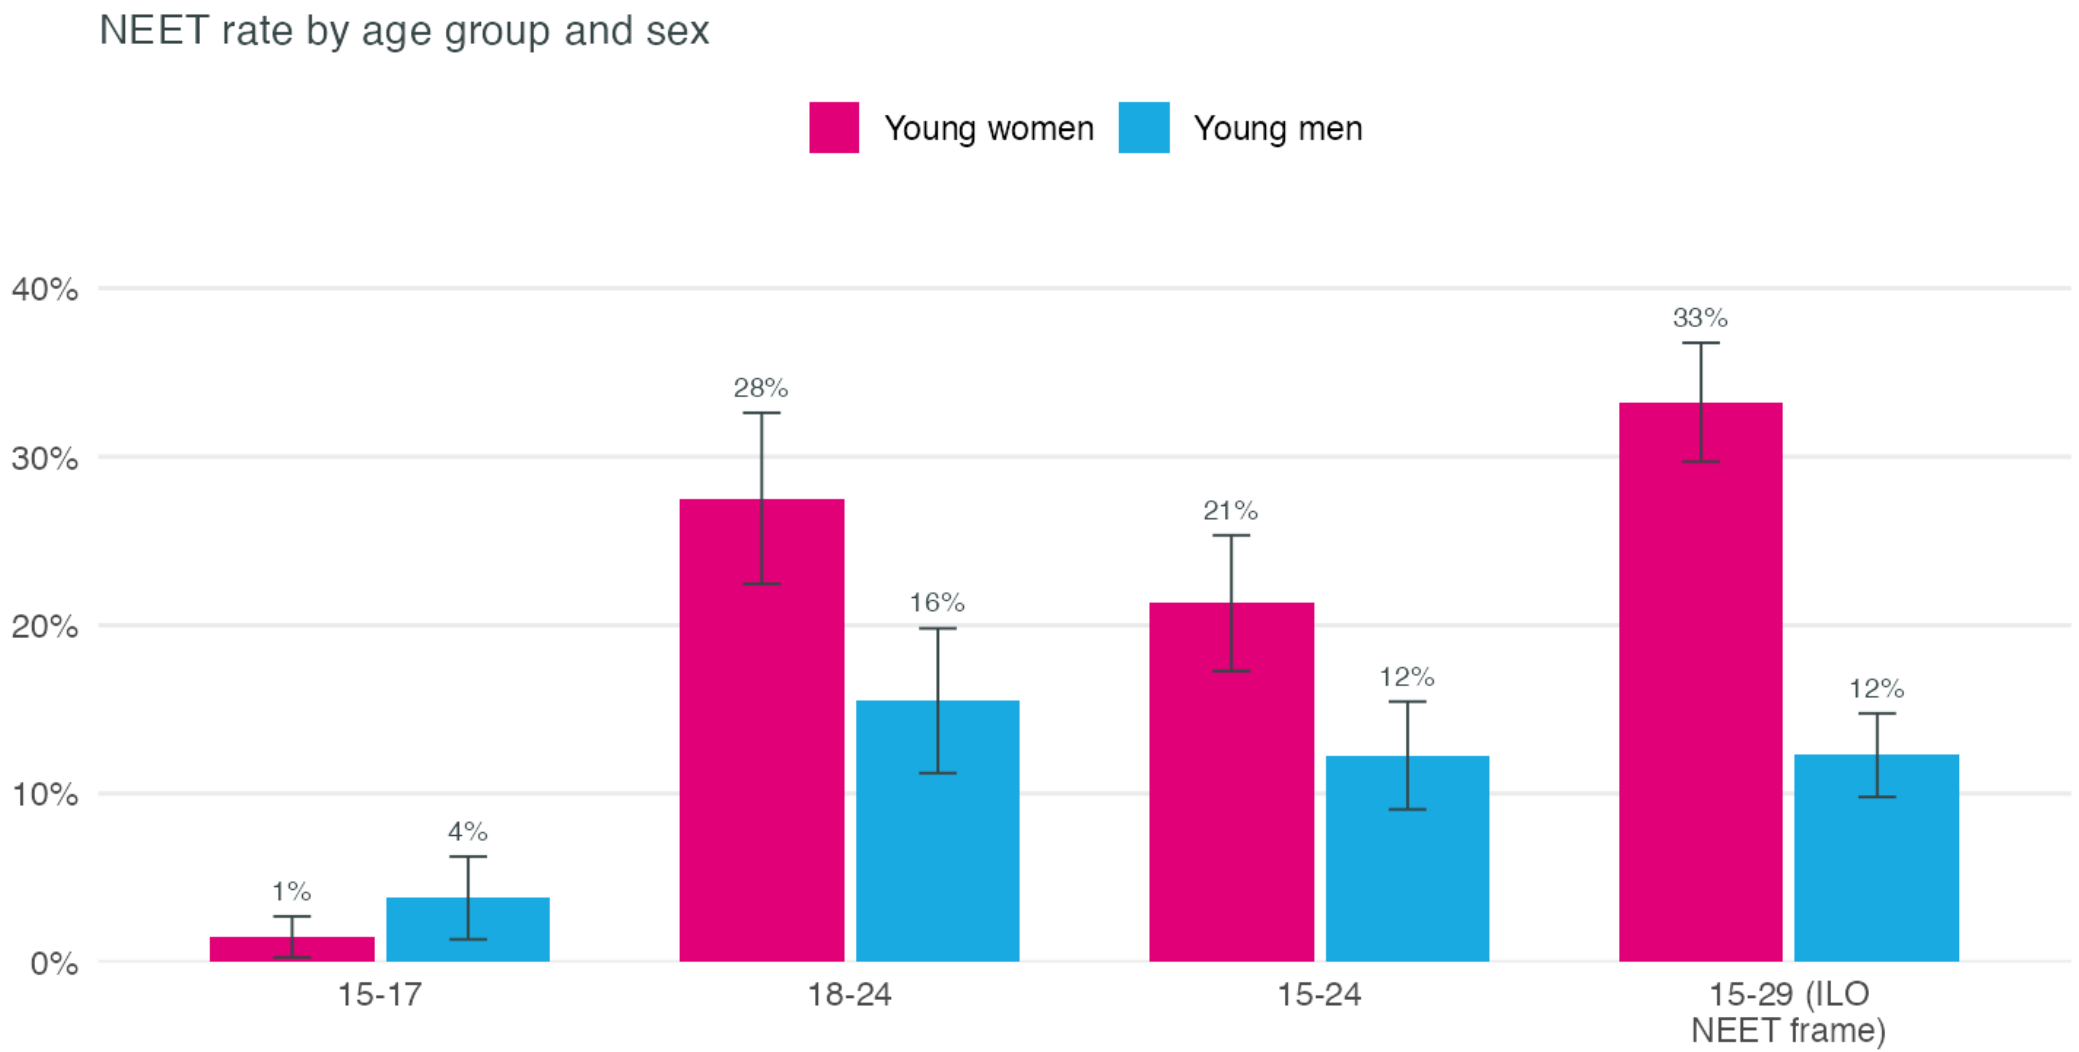

UNICEF HSESS 2023/24 (Dec 2023 to Feb 2024), weighted, 95% CIs clustered by household.

Labour-force participation at 18–24: 46% for women and 46% for men (HSESS 2023/24)

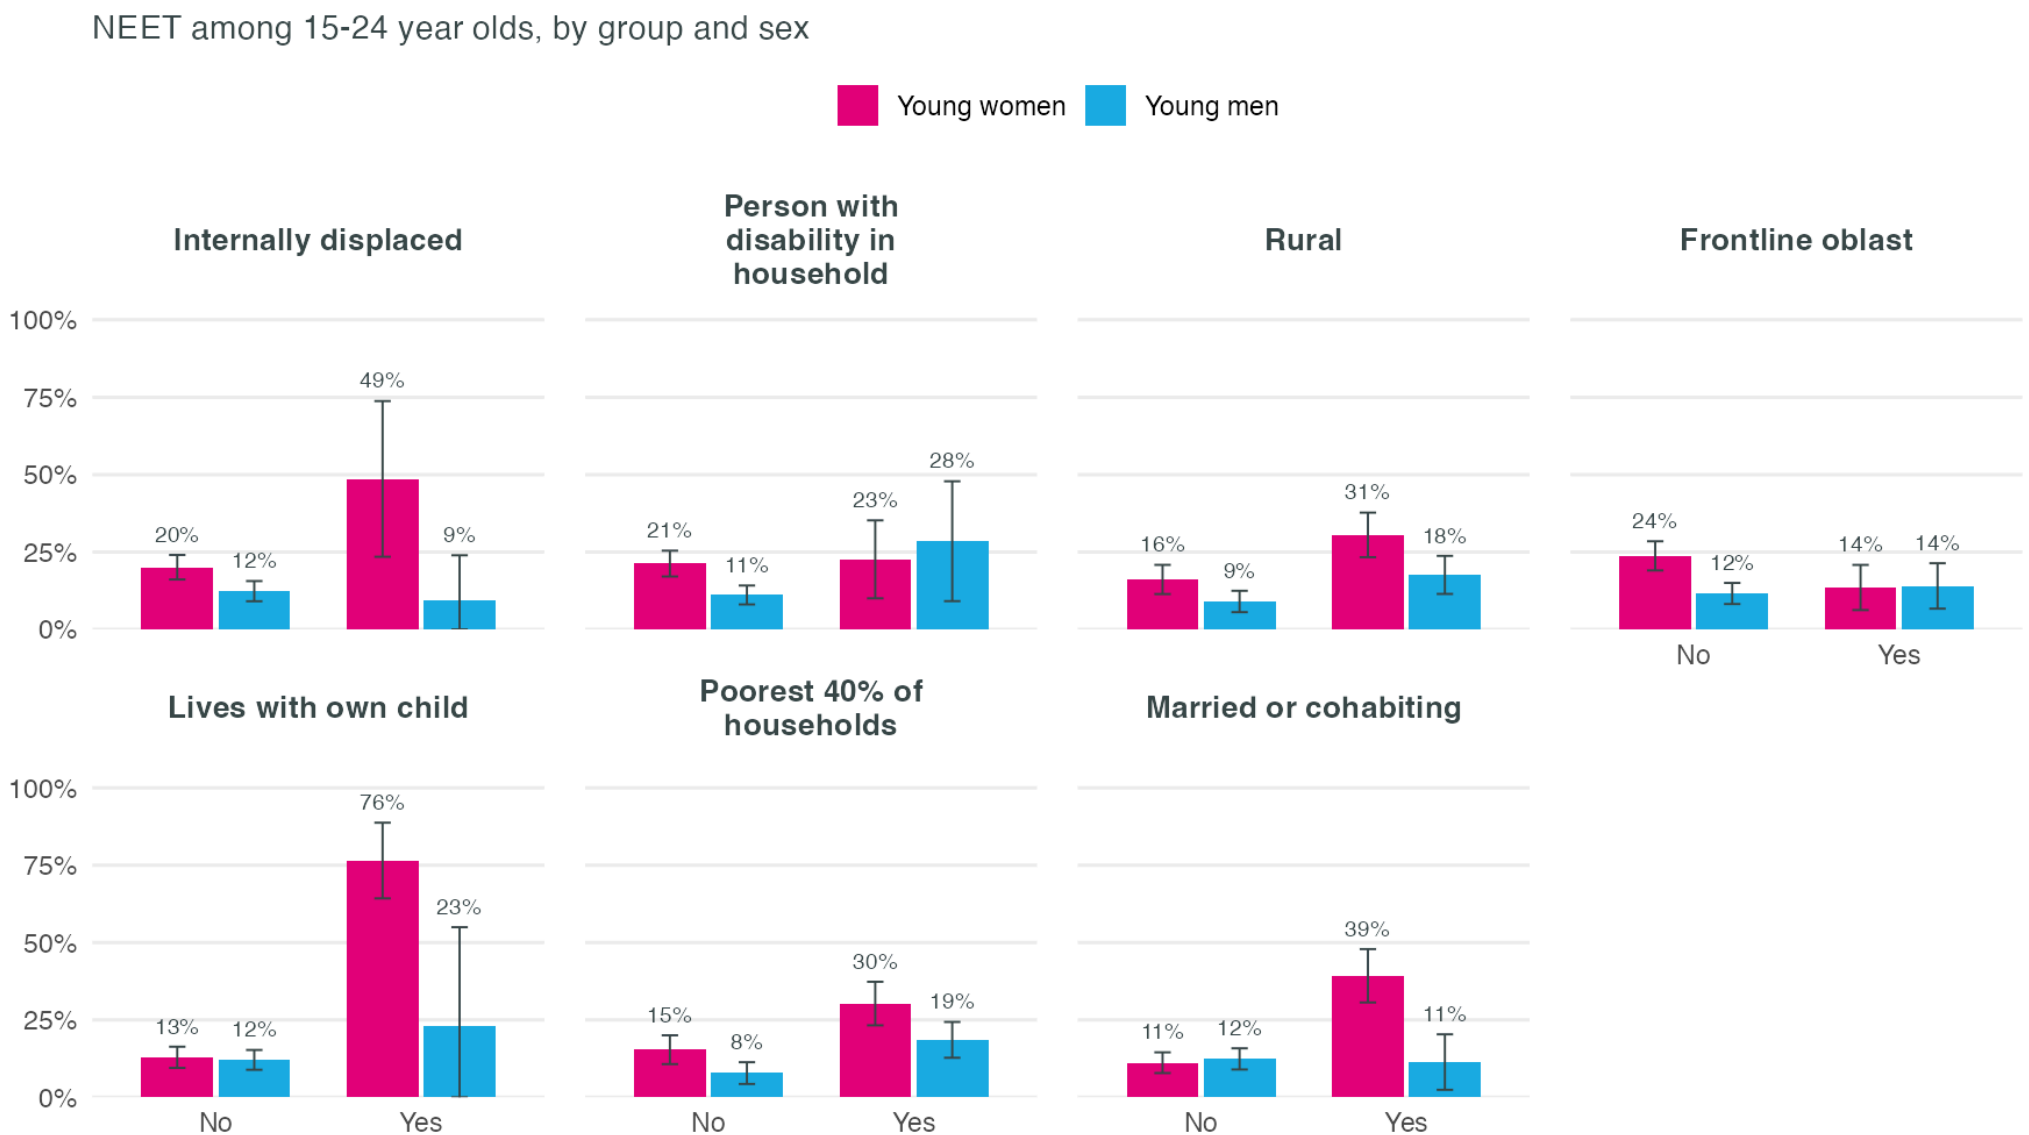

NEET rate by age group and sex (HSESS 2023/24)

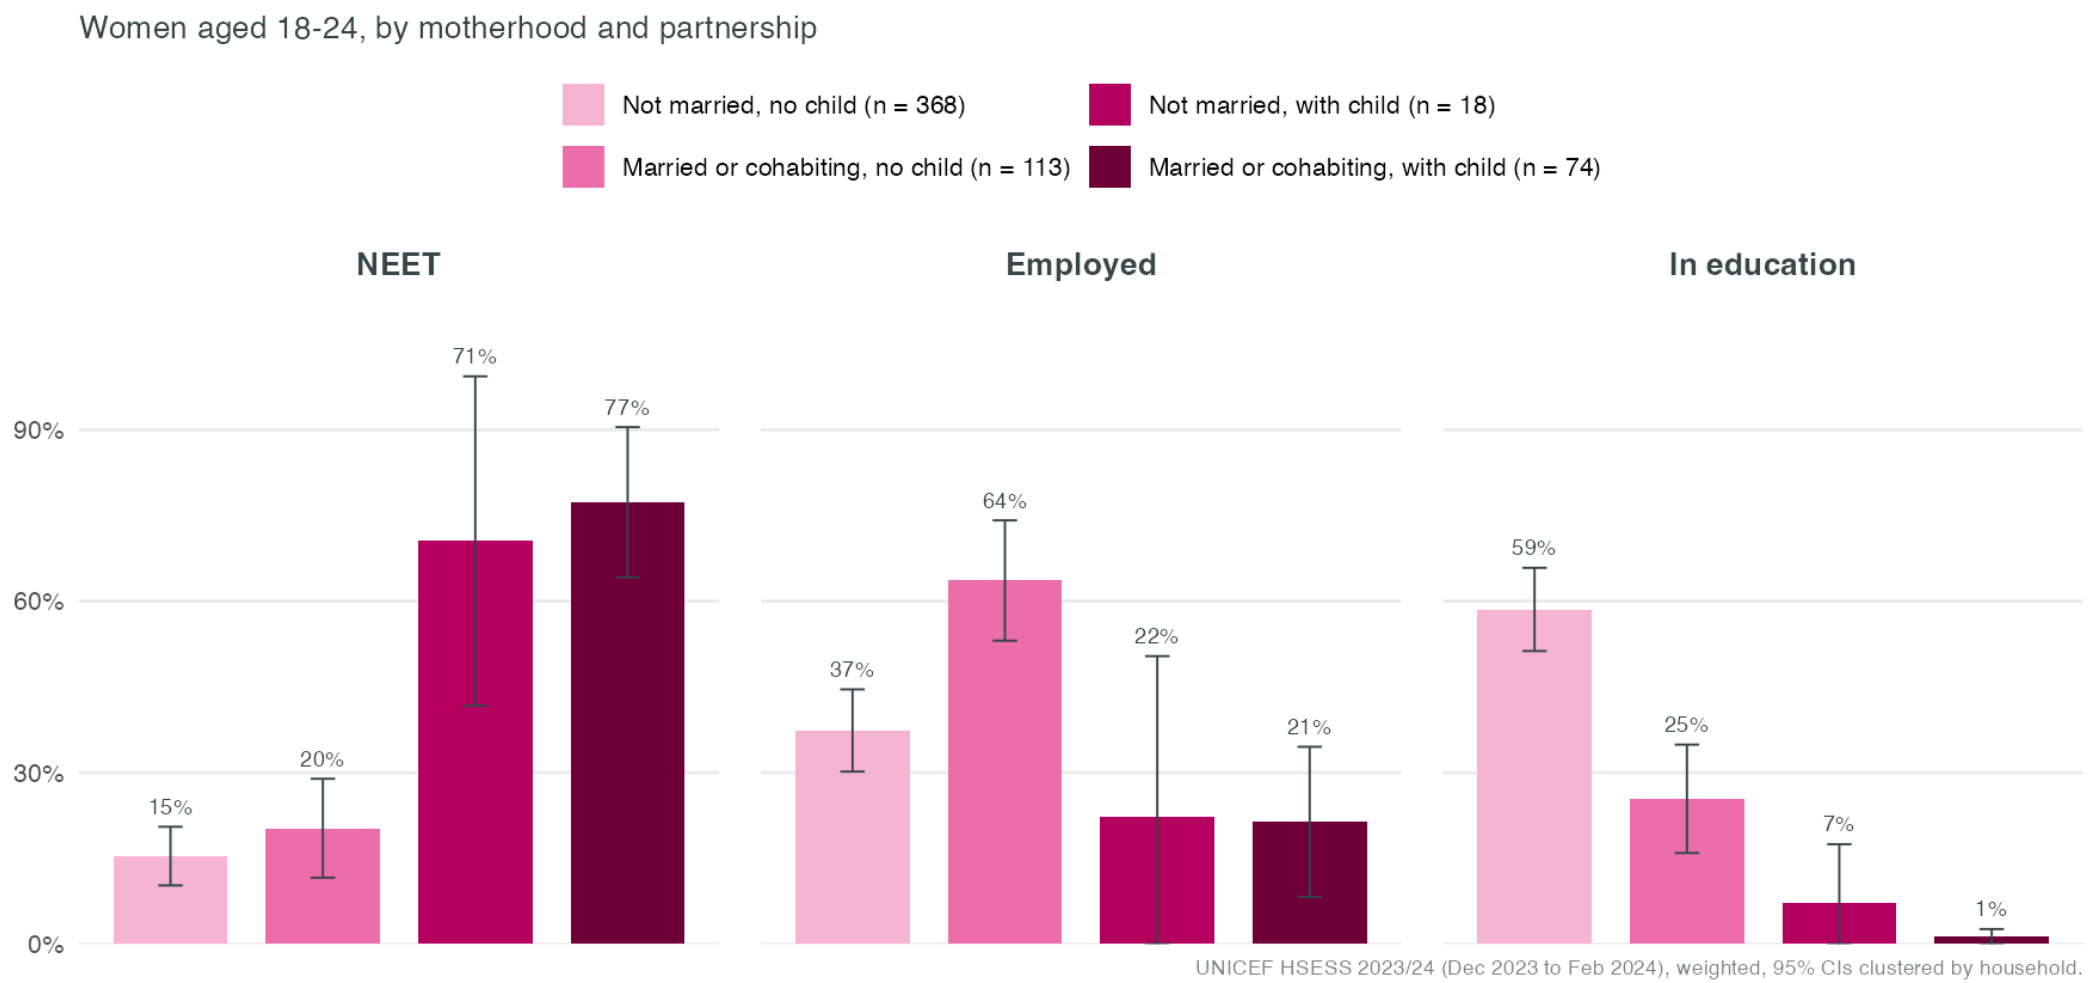

UNICEF HSESS 2023/24 (Dec 2023 to Feb 2024), weighted, 95% CIs clustered by household.

NEET at 15–24 by displacement, disability, income, location and parenthood (HSESS 2023/24)

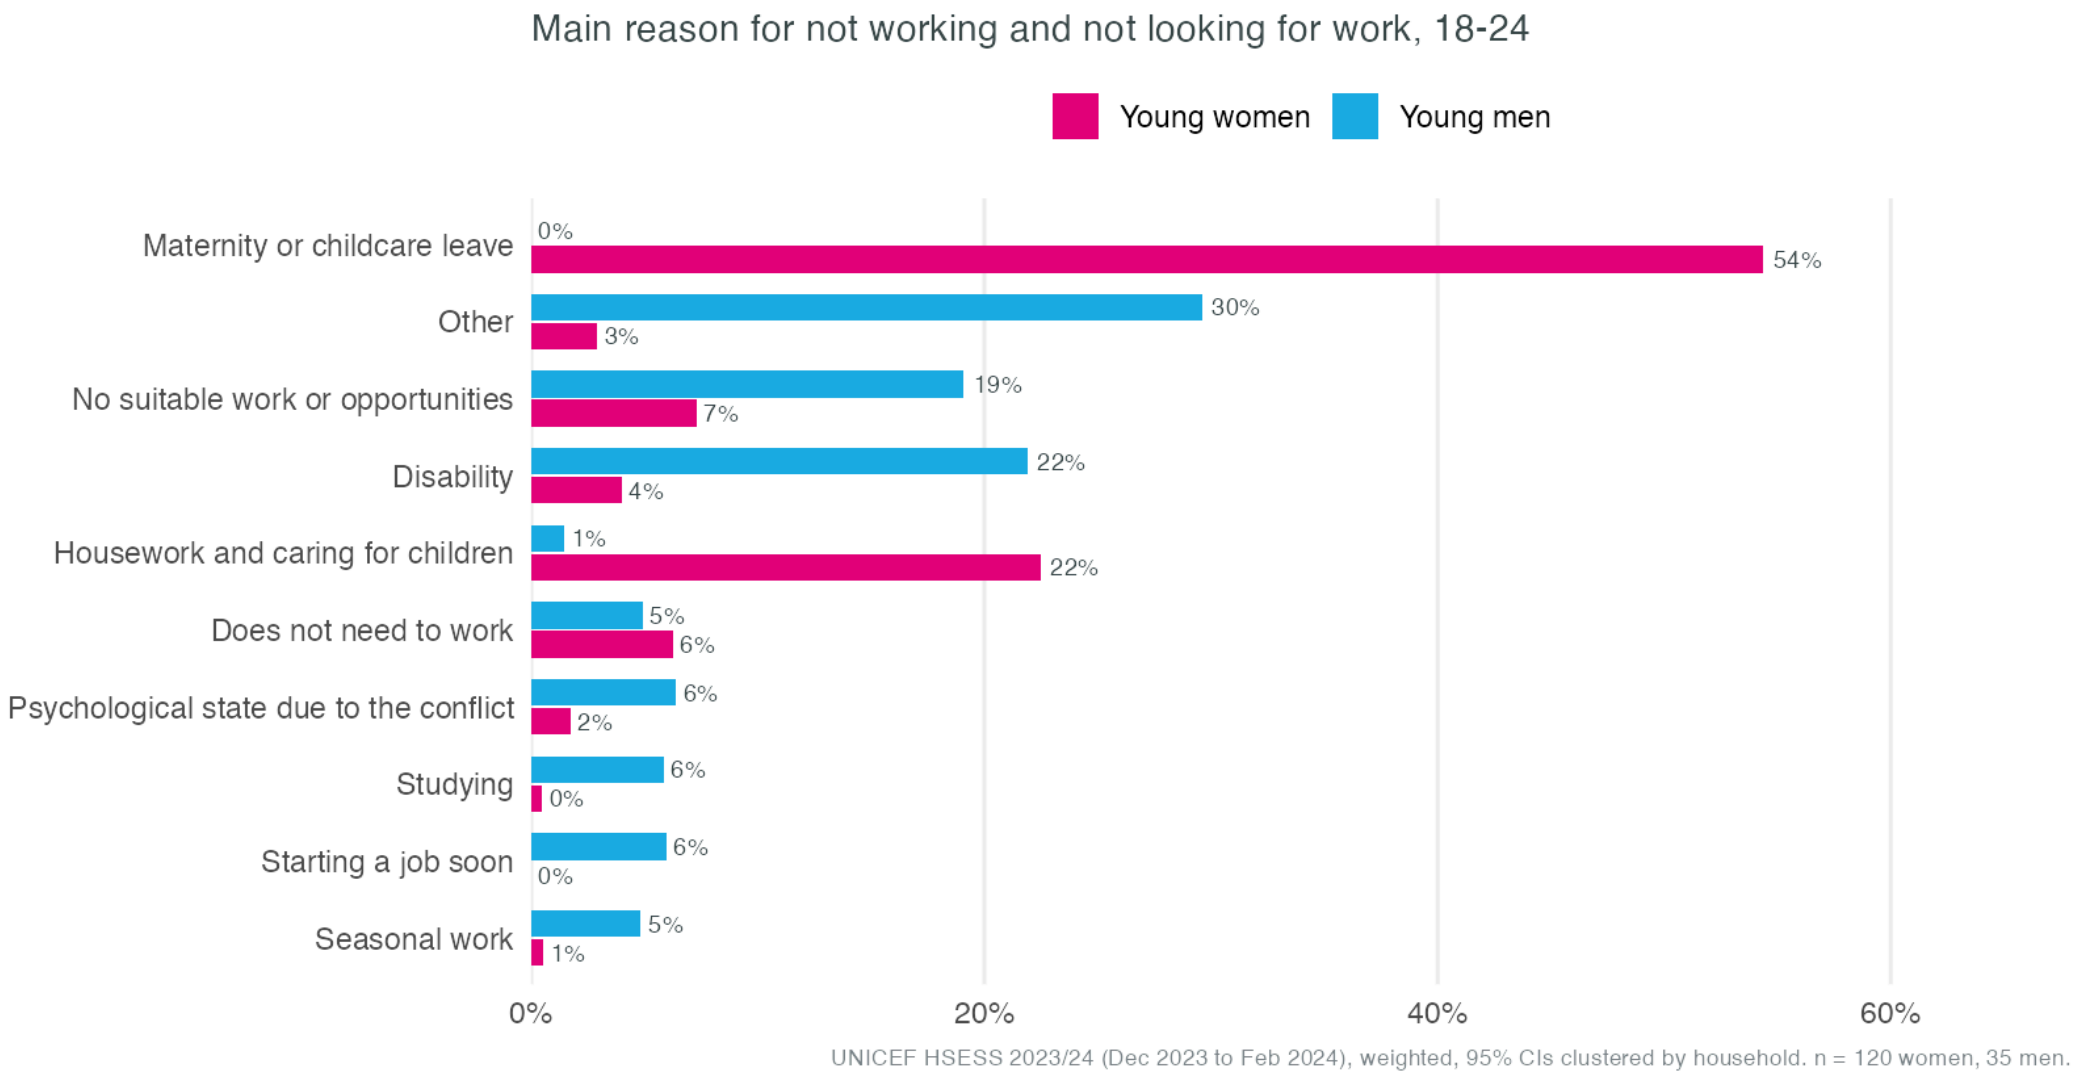

UNICEF HSESS 2023/24 (Dec 2023 to Feb 2024), weighted, 95% CIs clustered by household. Some groups are small; see the n in the table.

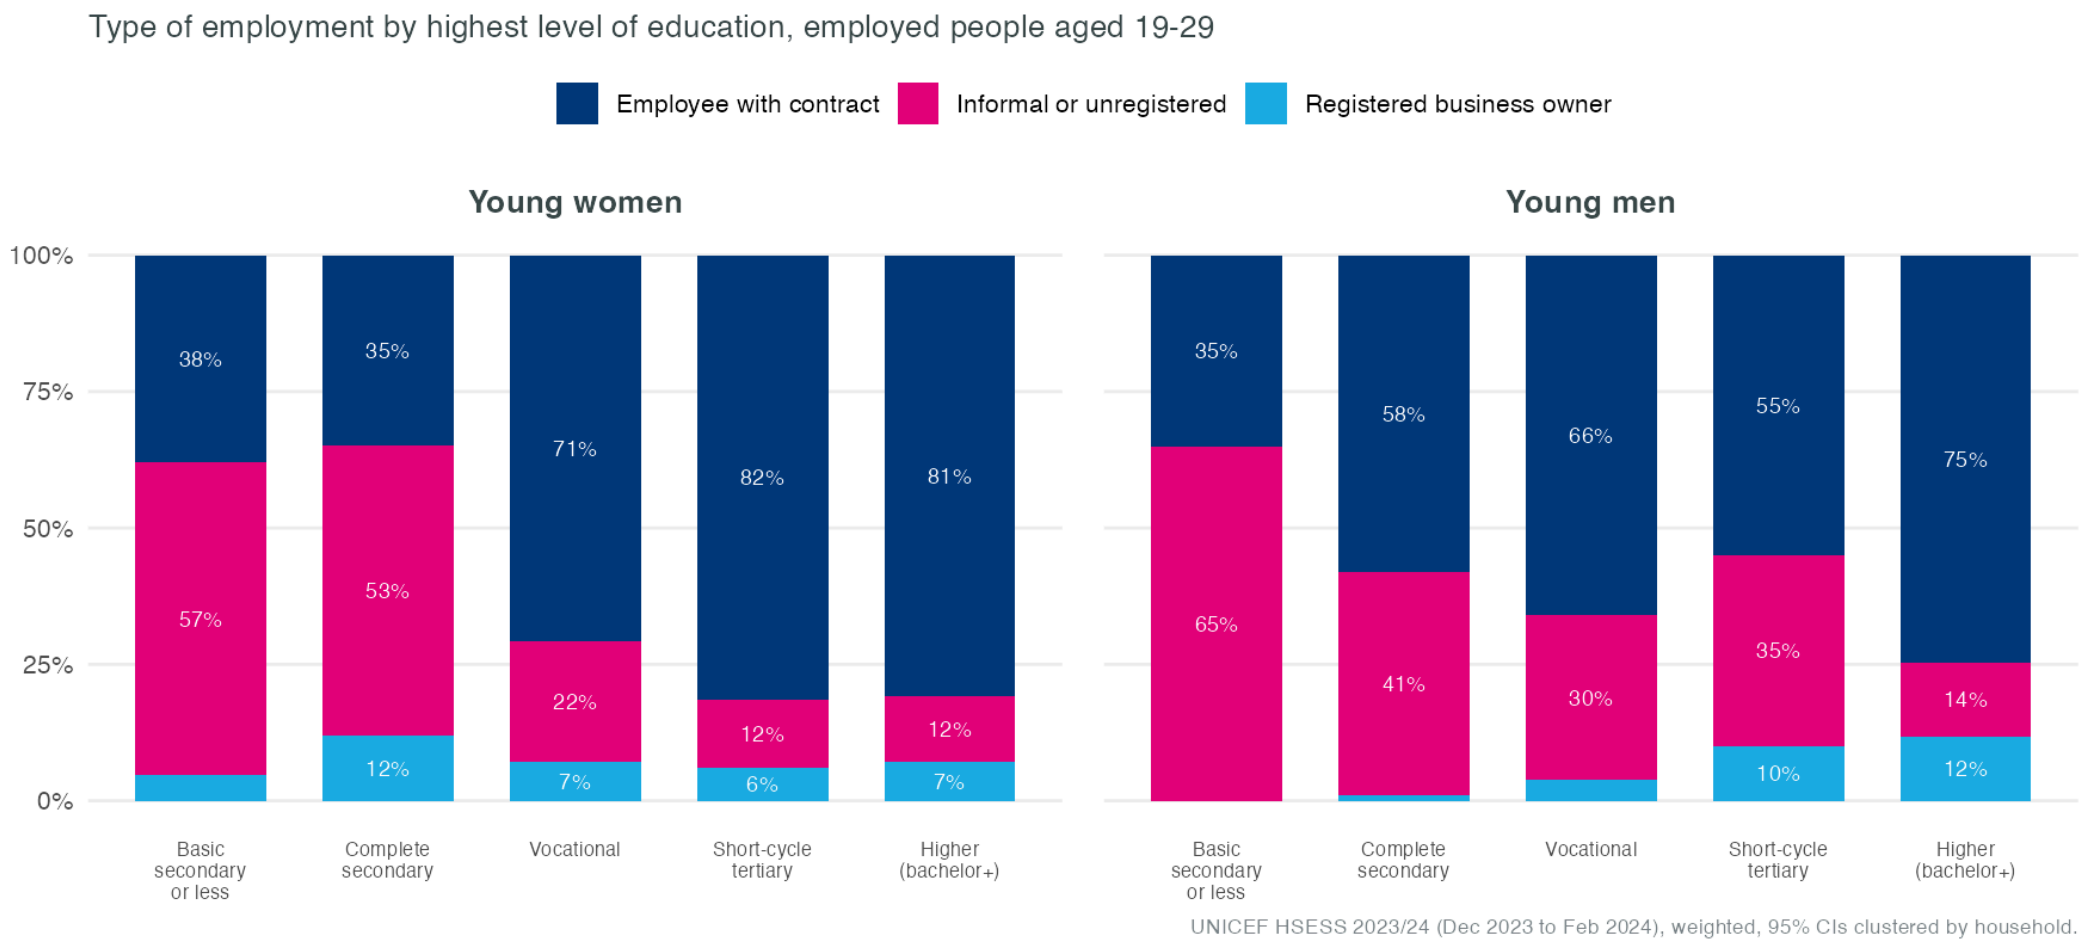

Women 18–24 by motherhood and partnership (HSESS 2023/24)

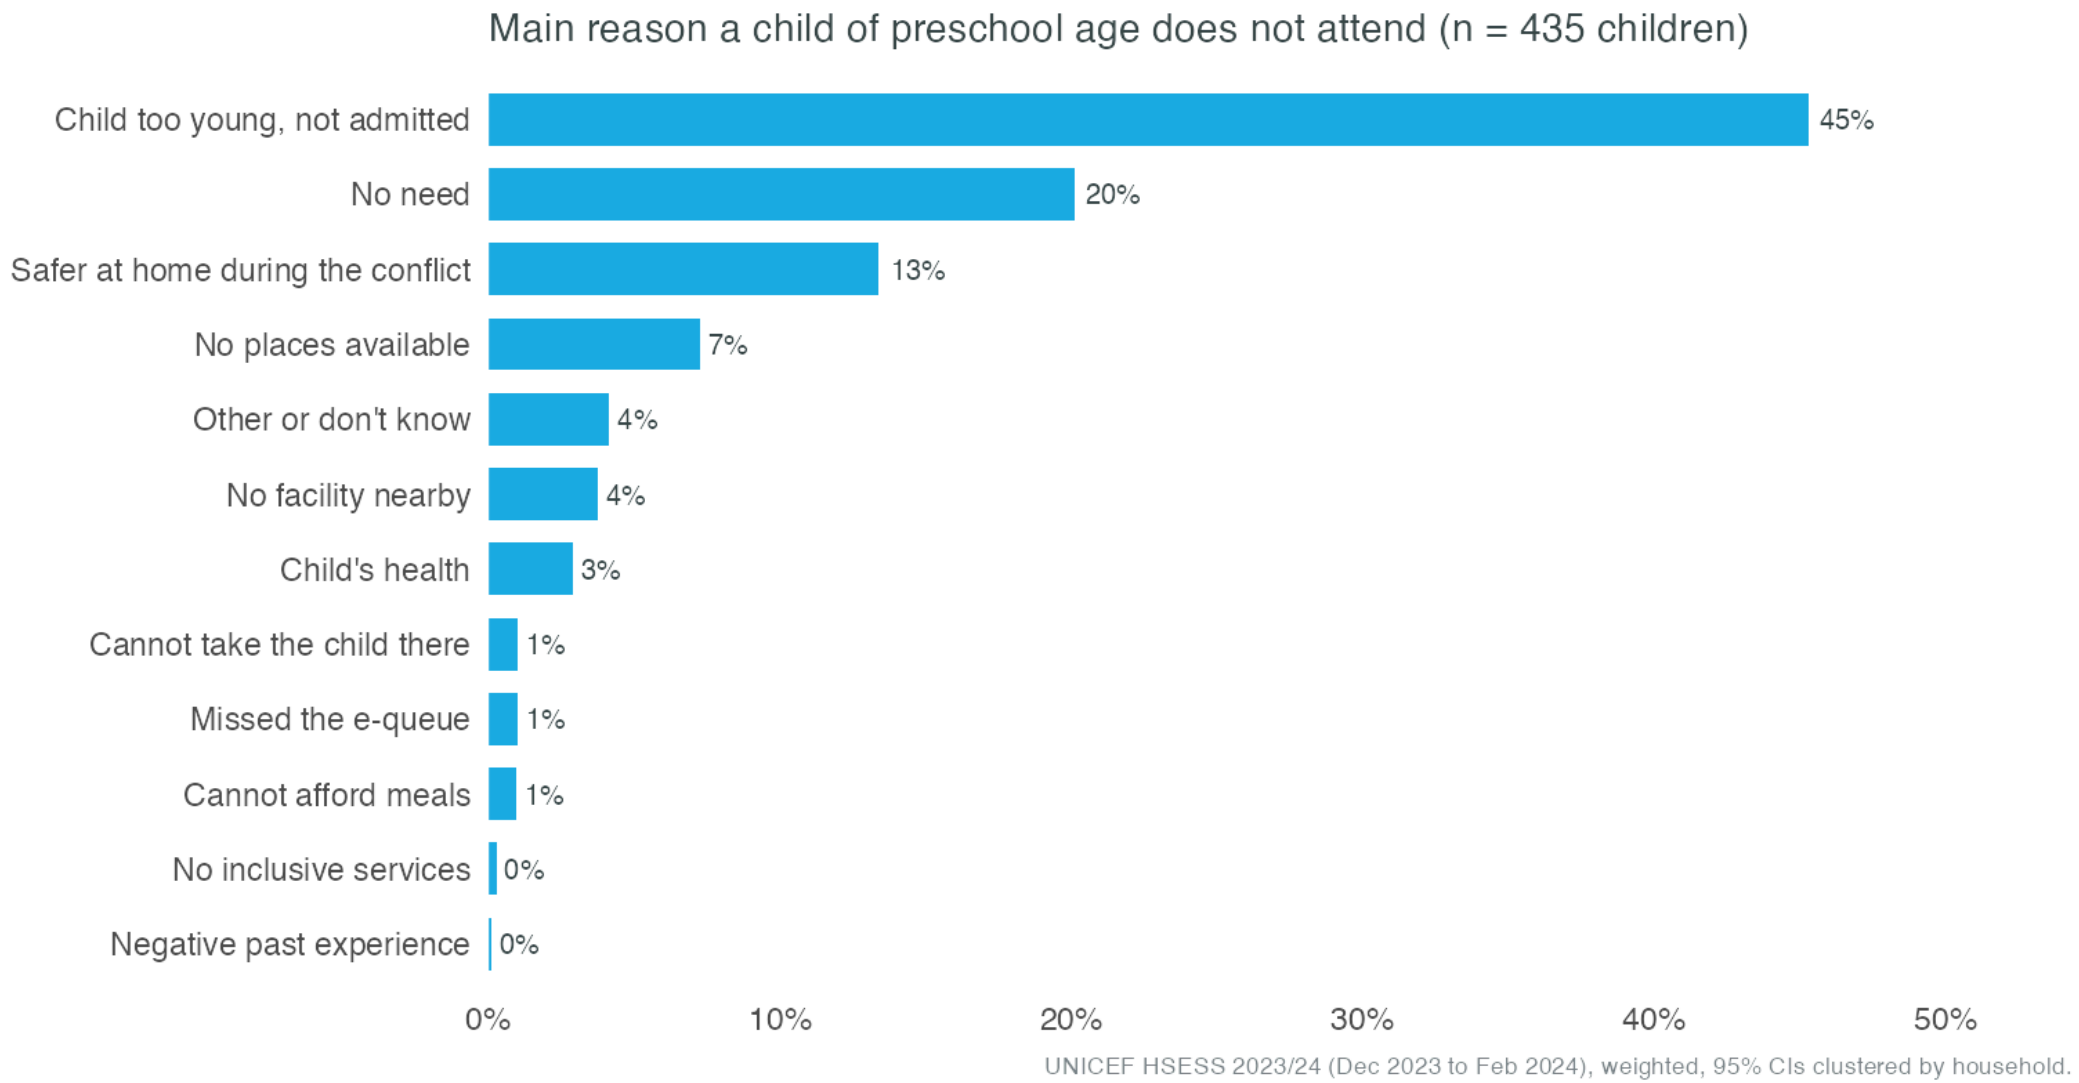

Reasons for not working and not looking for work, detailed categories (HSESS 2023/24)

Type of employment by level of education, employed 19–29 (HSESS 2023/24)

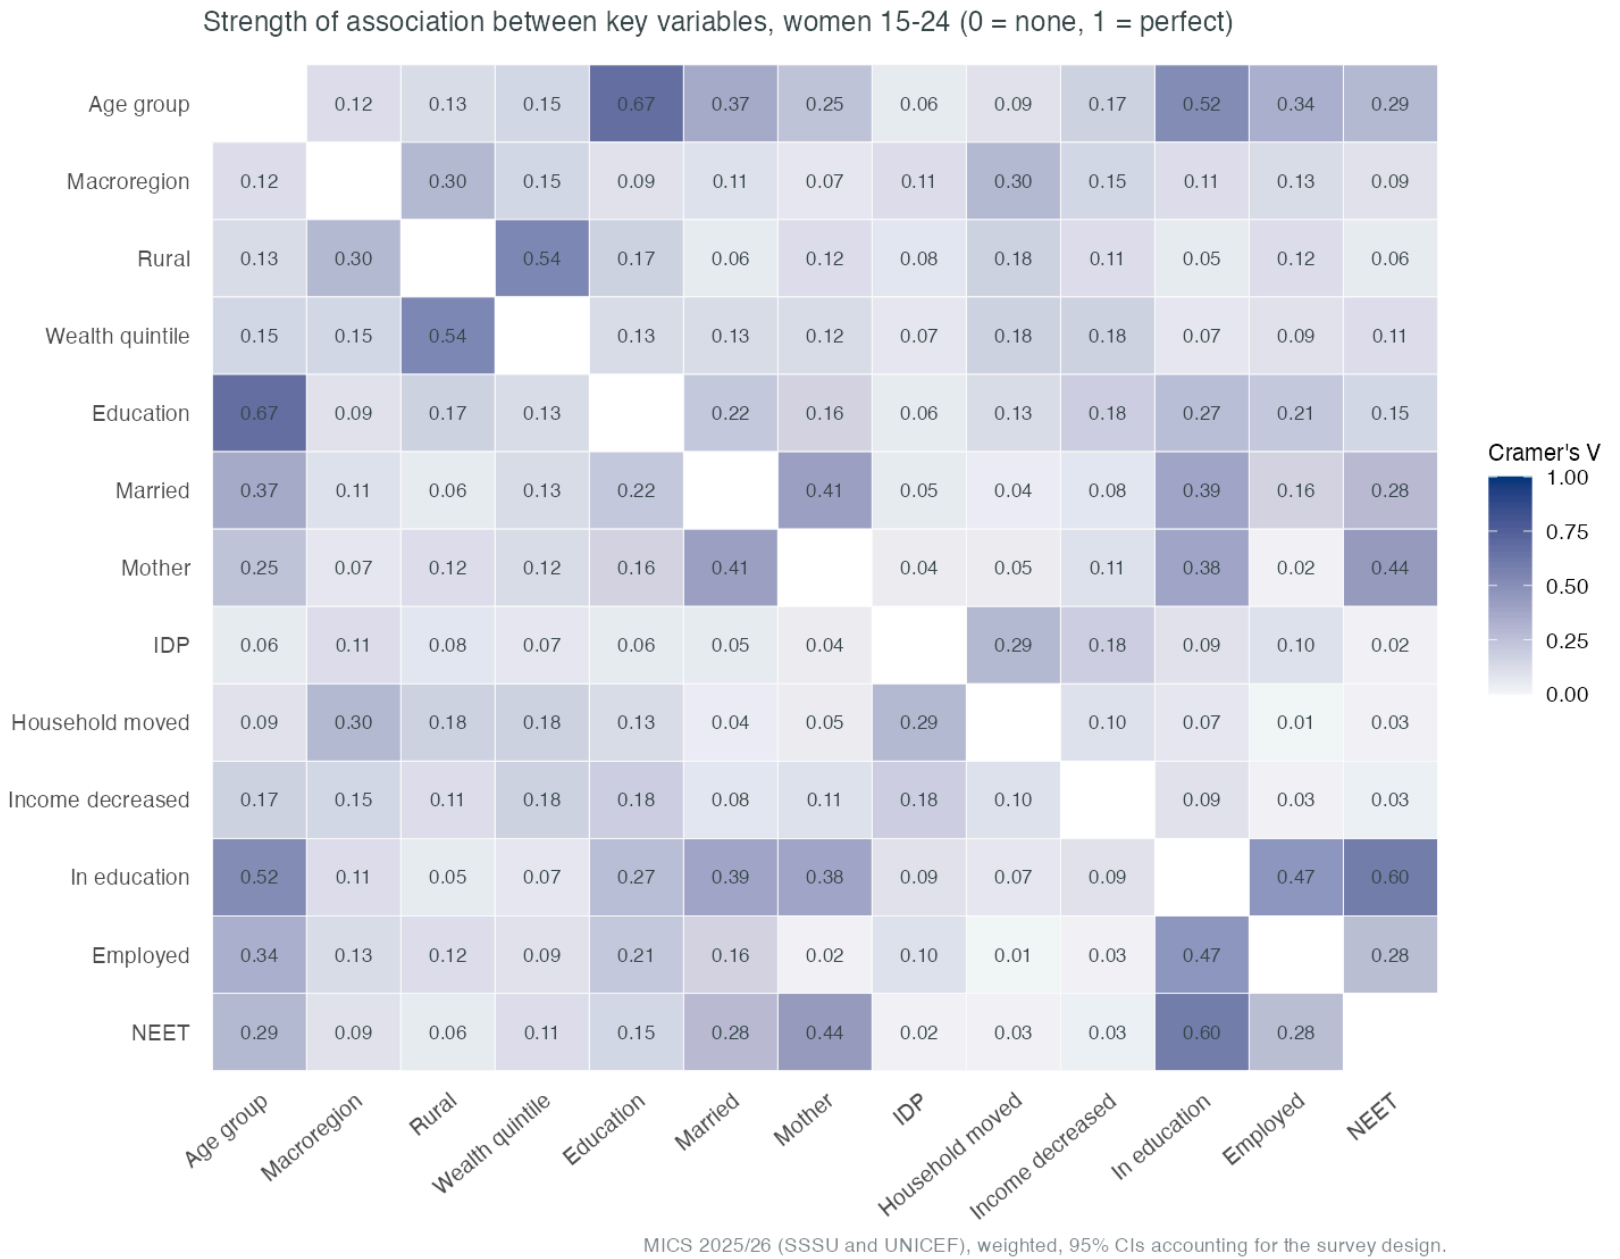

Main reason children of preschool age do not attend preschool (HSESS 2023/24)

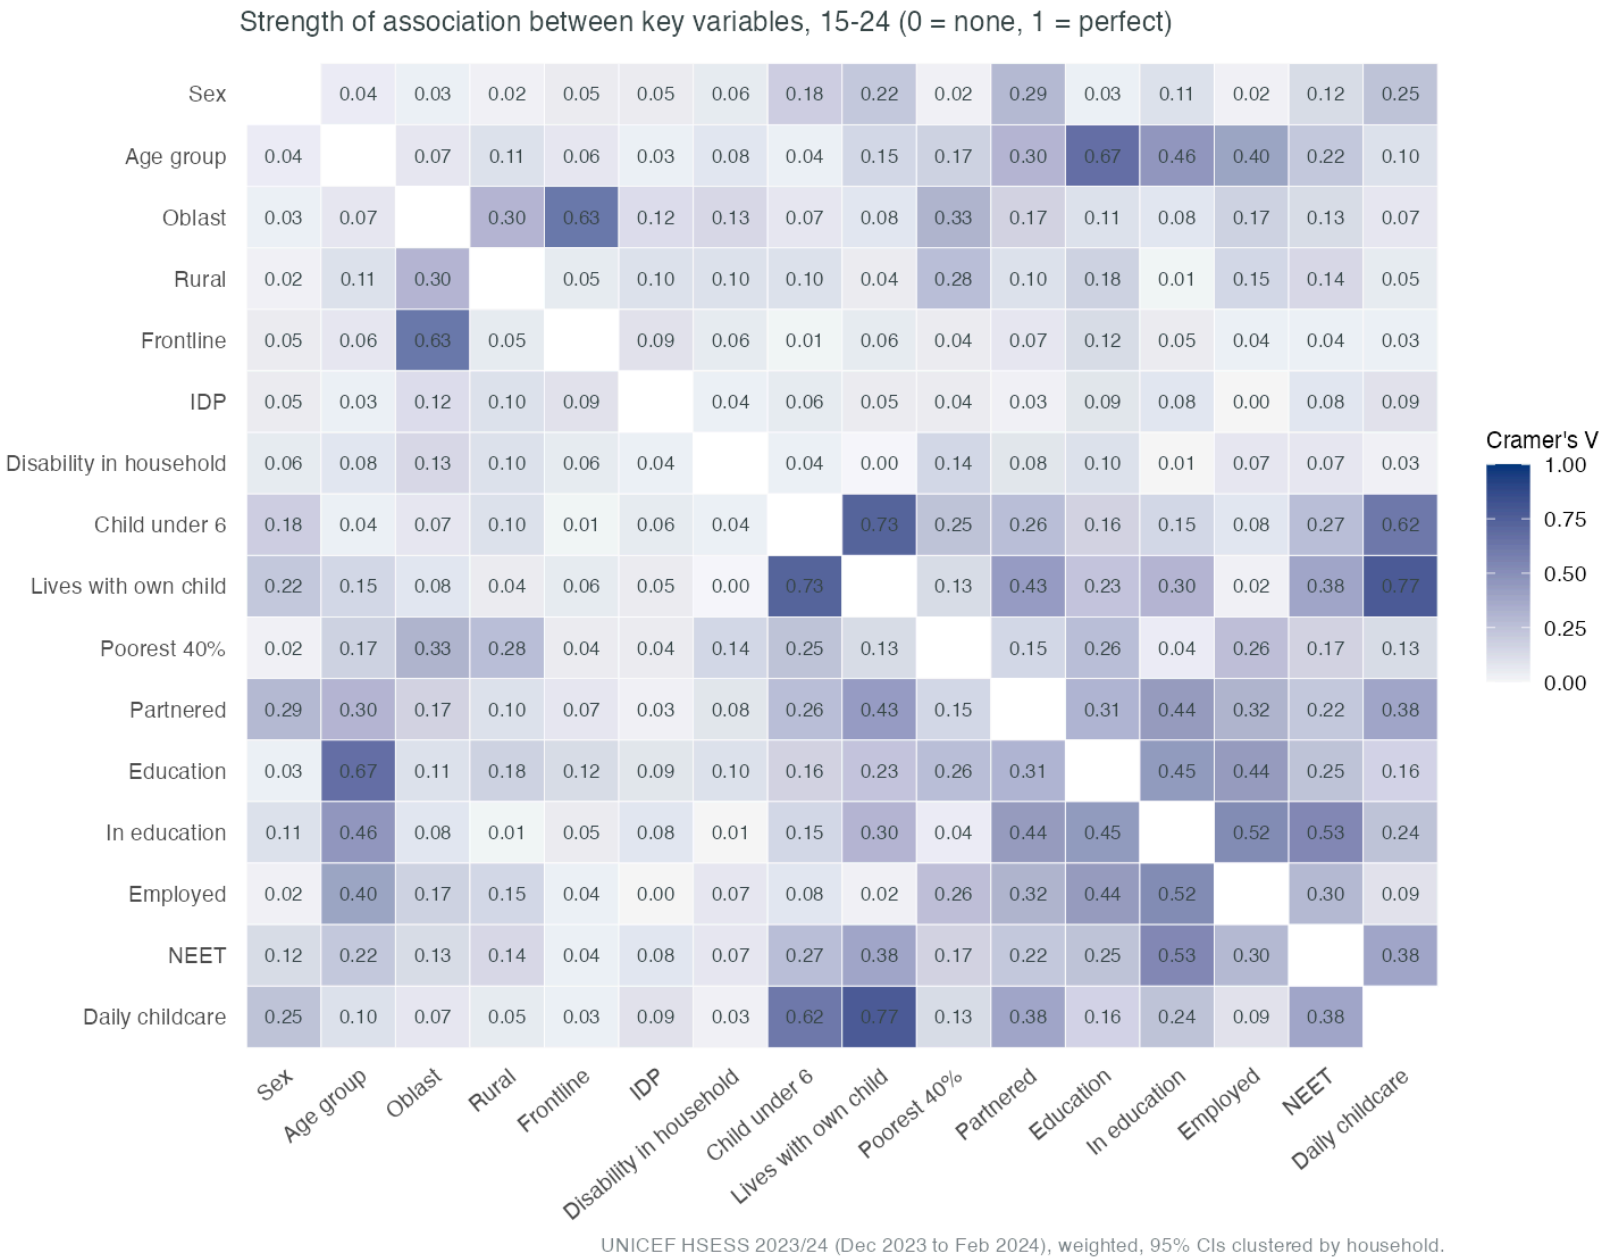

UNICEF HSESS 2023/24 (Dec 2023 to Feb 2024), weighted, 95% CIs clustered by household.

Association between key variables, women 15–24 (MICS 2025/26)

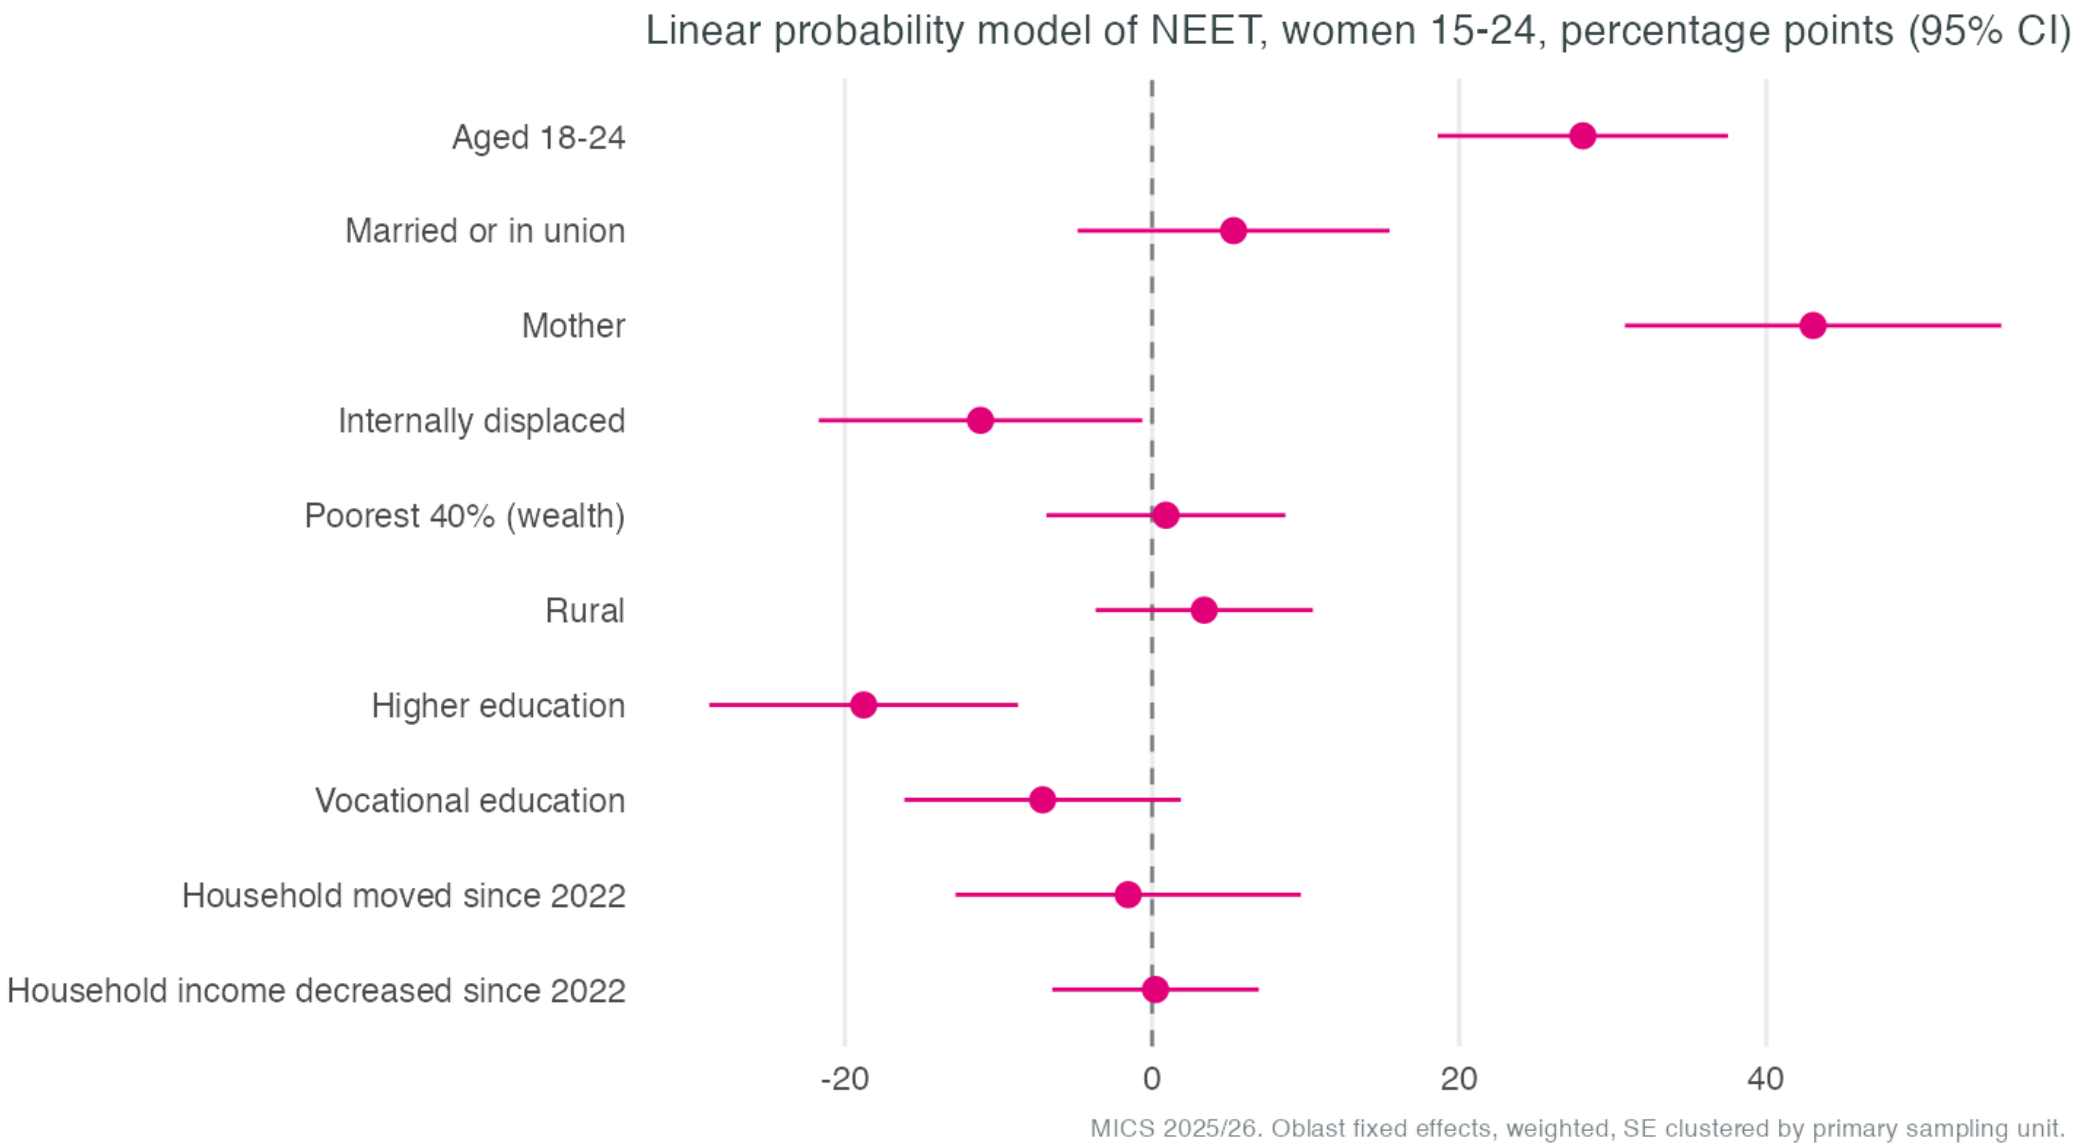

MICS 2025/26 (SSSU and UNICEF), weighted, 95% CIs accounting for the survey design.

Association between key variables, 15–24 (HSESS 2023/24)

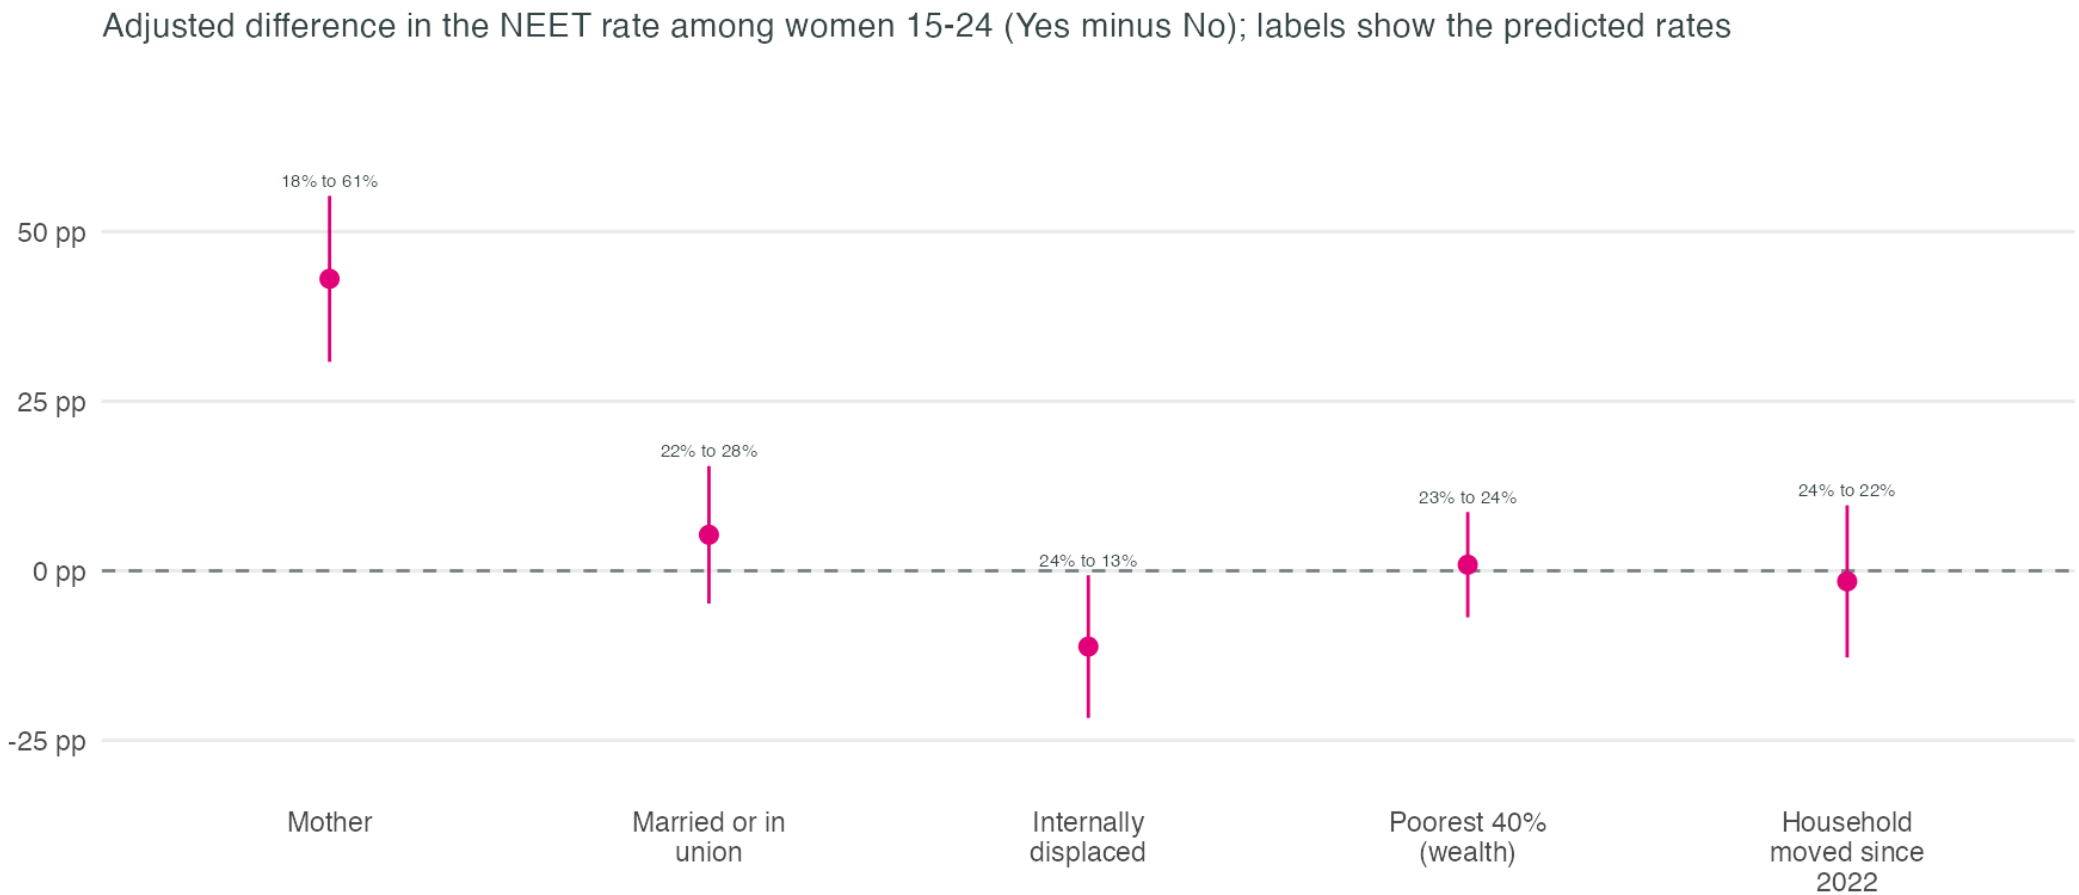

UNICEF HSESS 2023/24 (Dec 2023 to Feb 2024), weighted, 95% CIs clustered by household.

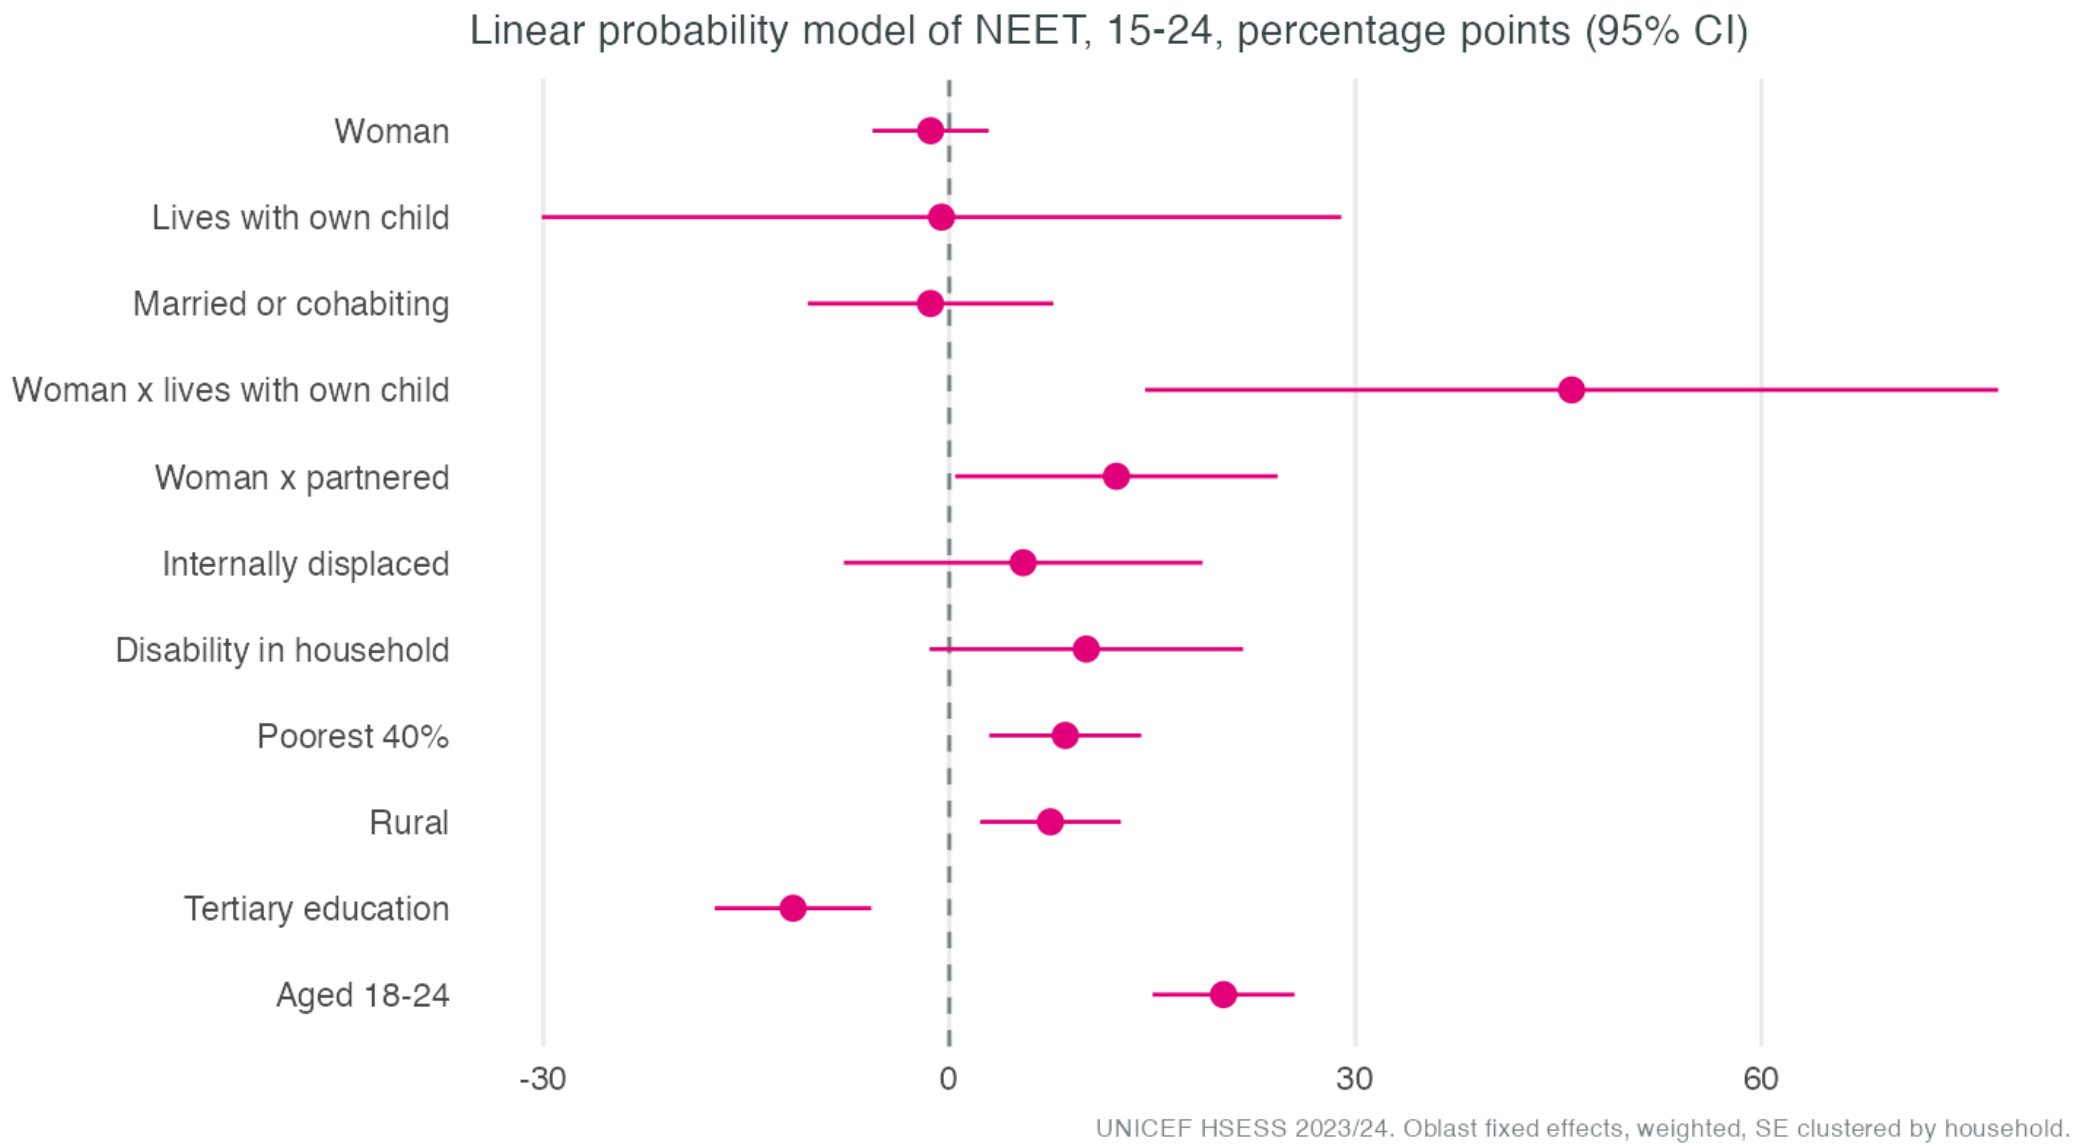

Linear probability model of NEET, women 15–24 (MICS 2025/26)

Adjusted differences in NEET by motherhood, marriage, displacement, wealth and household moves (MICS 2025/26)

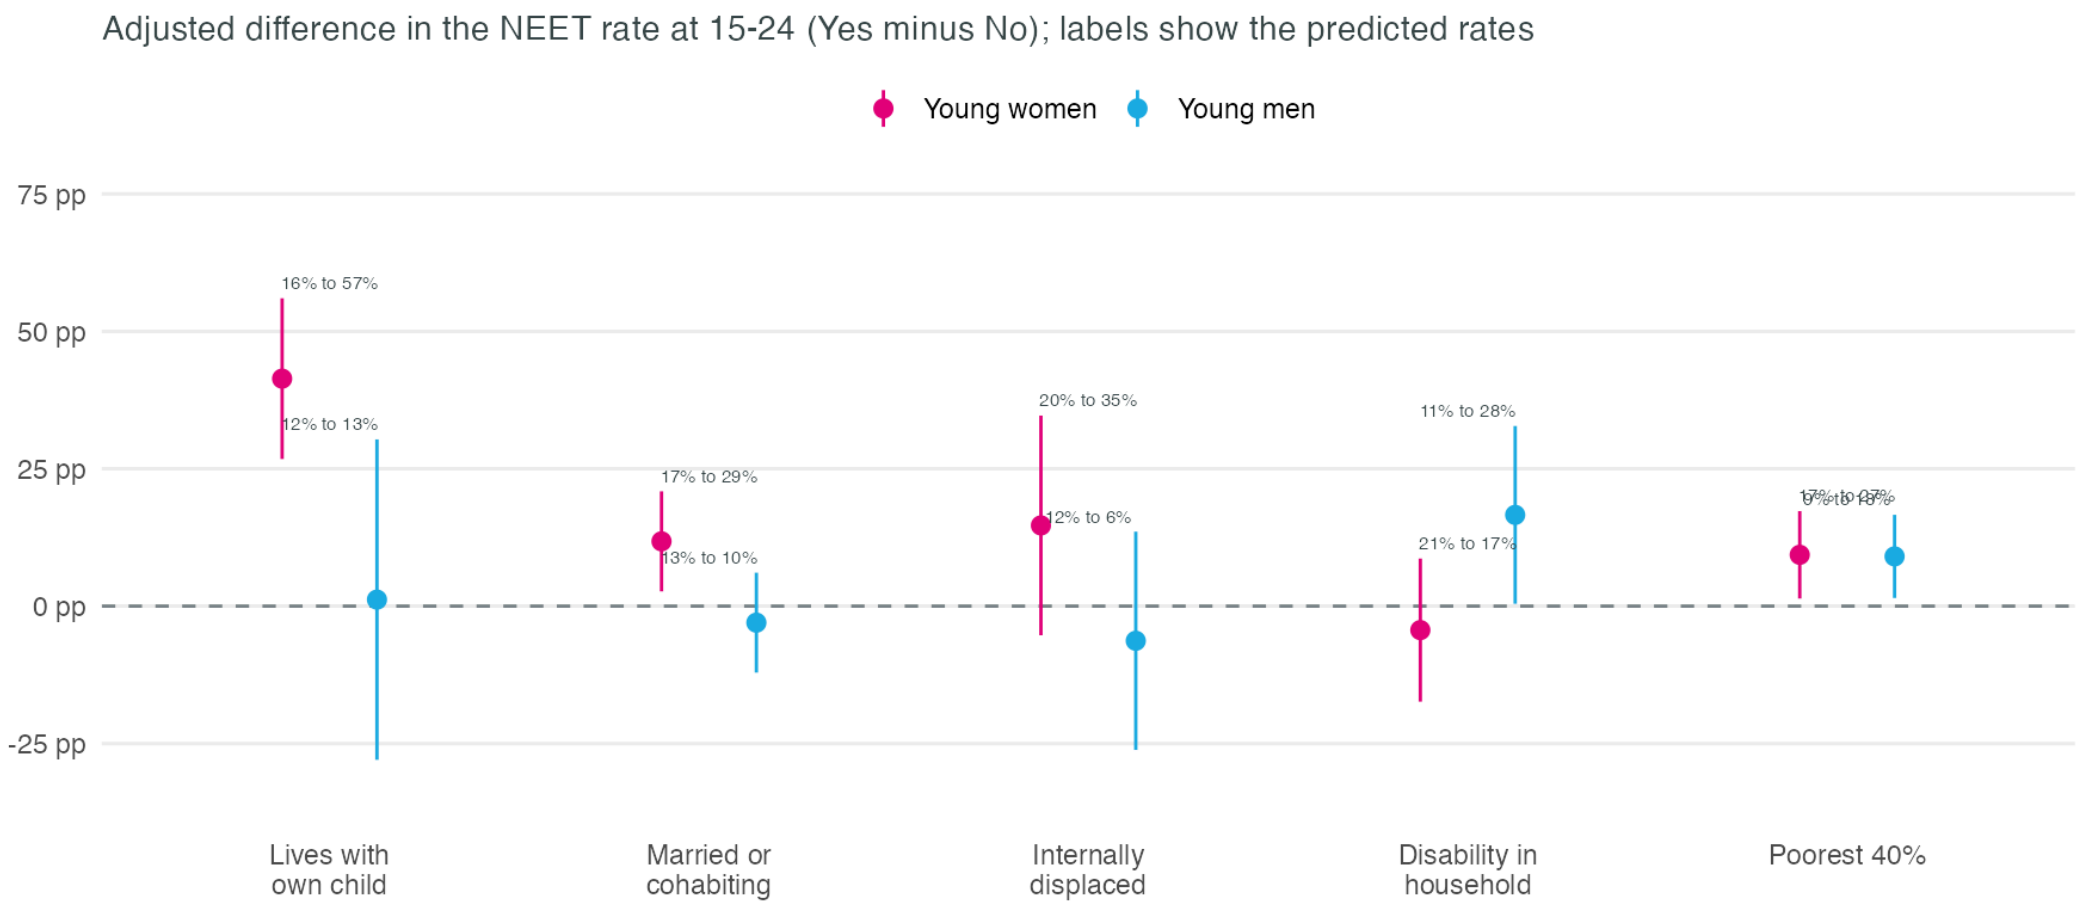

Linear probability model of NEET, 15–24 (HSESS 2023/24)

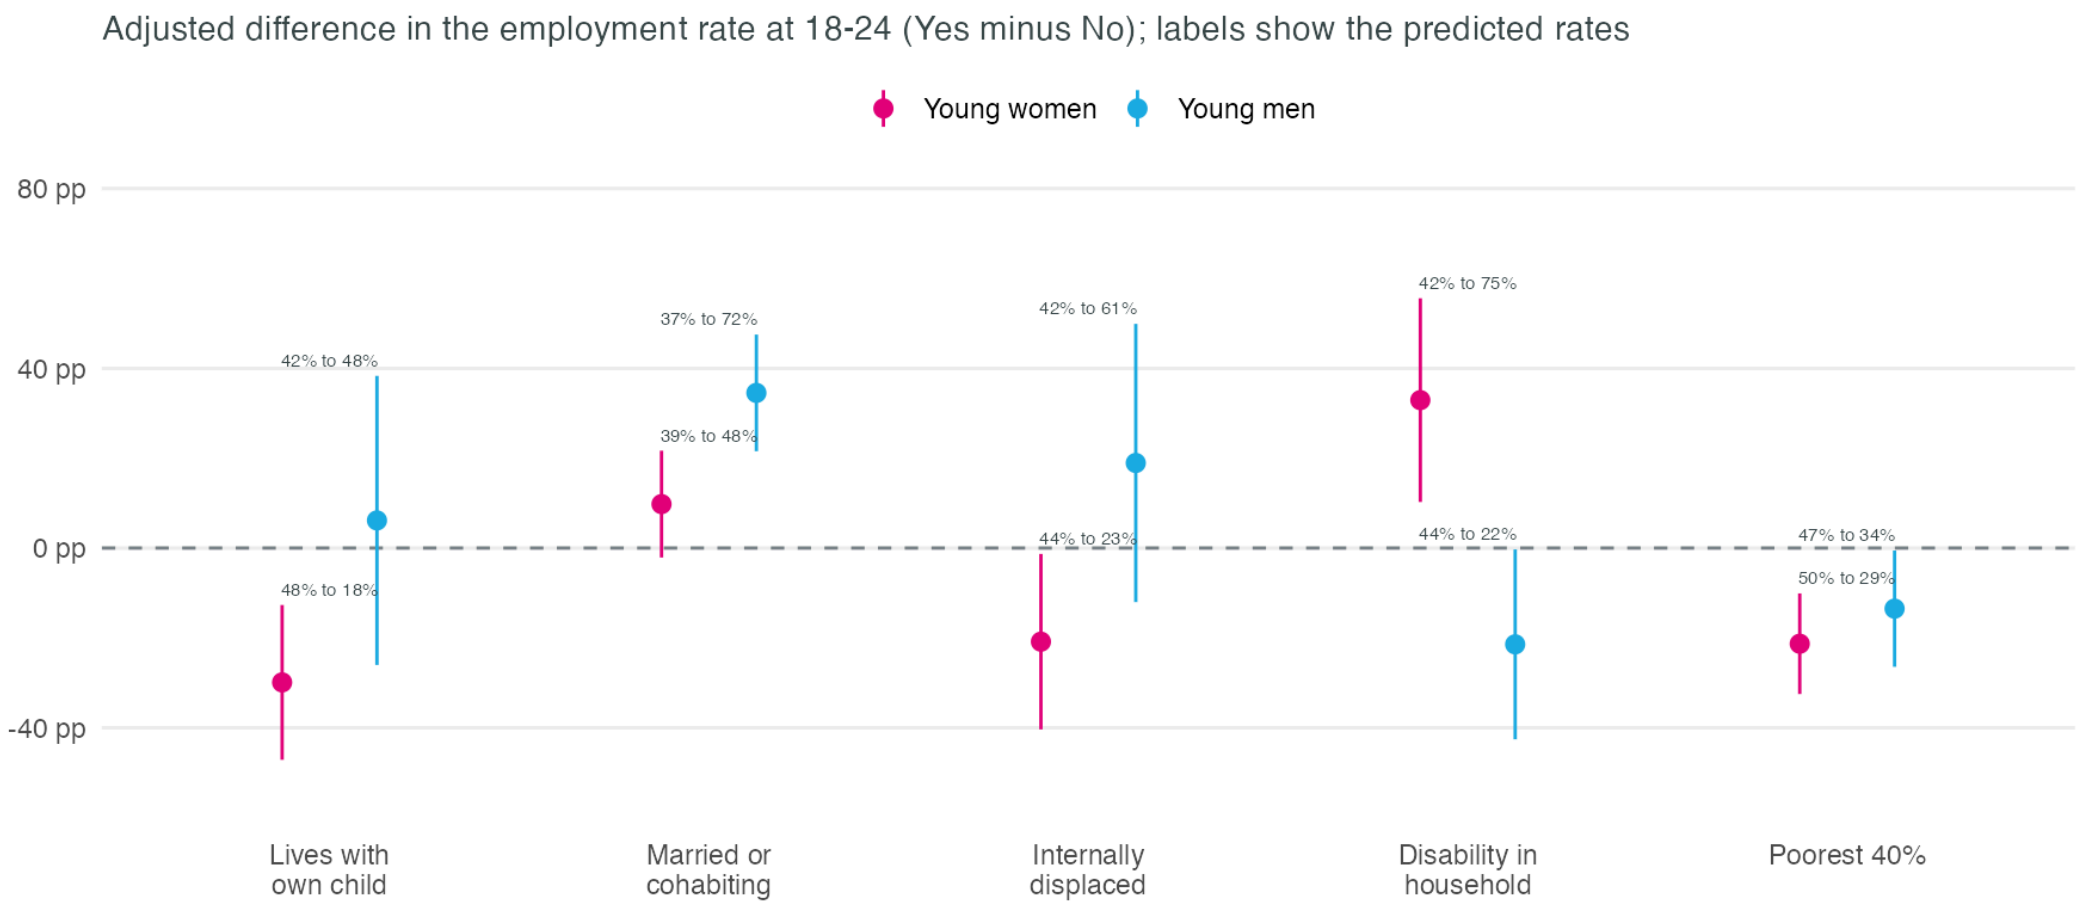

UNICEF HSESS 2023/24. Oblast fixed effects, weighted, SE clustered by household.

Adjusted differences in NEET by motherhood, partnership, displacement, disability and income (HSESS 2023/24)

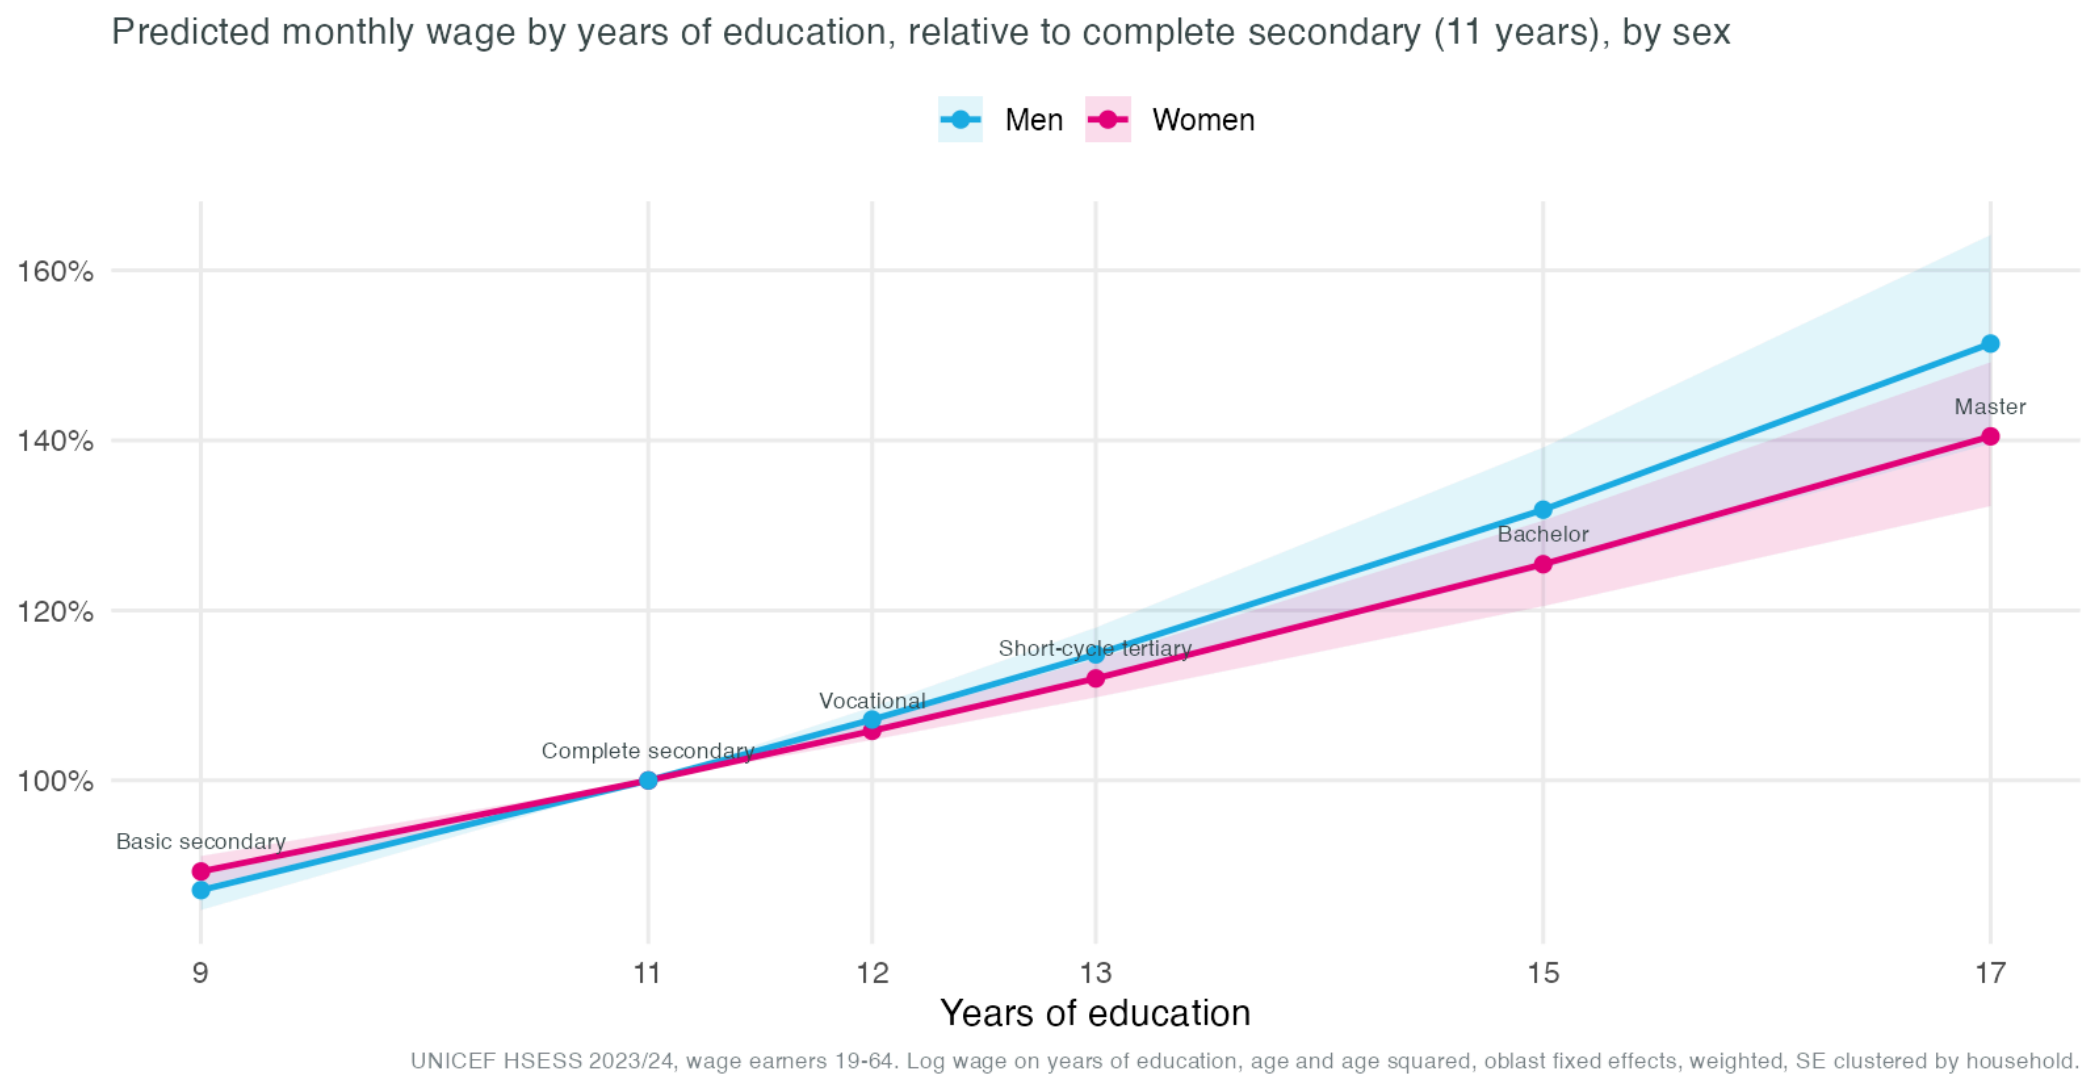

UNICEF HSESS 2023/24. Linear probability models with oblast fixed effects, estimated separately for women and men; predicted rates with everyone set to 'No' and then to 'Yes'; 95% CI on the difference.

Adjusted differences in employment by motherhood, partnership, displacement, disability and income (HSESS 2023/24)

UNICEF HSESS 2023/24. Linear probability models with oblast fixed effects, estimated separately for women and men; predicted rates with everyone set to 'No' and then to 'Yes'; 95% CI on the difference.

Wages and years of education: 5.8% per additional year for women, 7.2% for men (HSESS 2023/24)

Log monthly net wage on years of education, age and age squared, oblast fixed effects. Adjusted gap between women and men at the same education and age: 19.1%.

Estimates, MICS 2025/26

Estimate	Sample	Effect (pp)	SE	p	N
NEET: married or in union	Women 15-24	5.3	5.2	0.300	1060
NEET: mother	Women 15-24	43.1	6.2	<0.001	1060
NEET: married x mother	Women 15-24	6.2	12.7	0.620	1060
NEET: internally displaced	Women 15-24	-11.2	5.4	0.038	1060
NEET: poorest 40% (wealth)	Women 15-24	0.9	4.0	0.820	1060
NEET: rural	Women 15-24	3.4	3.6	0.350	1060
NEET: household moved since 2022	Women 15-24	-1.6	5.7	0.790	1060
NEET: household income decreased since 2022	Women 15-24	0.2	3.4	0.950	1060
NEET: functional difficulty	Women 18-24	12.7	17.9	0.480	709

Effects in percentage points. Controls: age 18–24, marital status, motherhood, displacement, poorest 40%, rural, education level, household moved and household income decreased since 2022, oblast fixed effects. Functional difficulty is estimated for women 18–24.

Estimates, HSESS 2023/24

Estimate	Sample	Effect (pp)	SE	p	N
NEET: women vs men	15-24	2.8	2.1	0.190	1684
NEET: woman x lives with own child	15-24	54.4	15.6	<0.001	1684
NEET: woman x married or cohabiting	15-24	19.2	6.4	0.003	1684
NEET: internally displaced	15-24	6.6	6.9	0.340	1684
NEET: person with disability in household	15-24	10.0	6.1	0.100	1684
NEET: poorest 40% of households	15-24	7.4	2.9	0.011	1684
NEET: woman x poorest 40%	15-24	2.2	4.8	0.640	1684
NEET: rural	15-24	8.7	2.7	0.001	1684

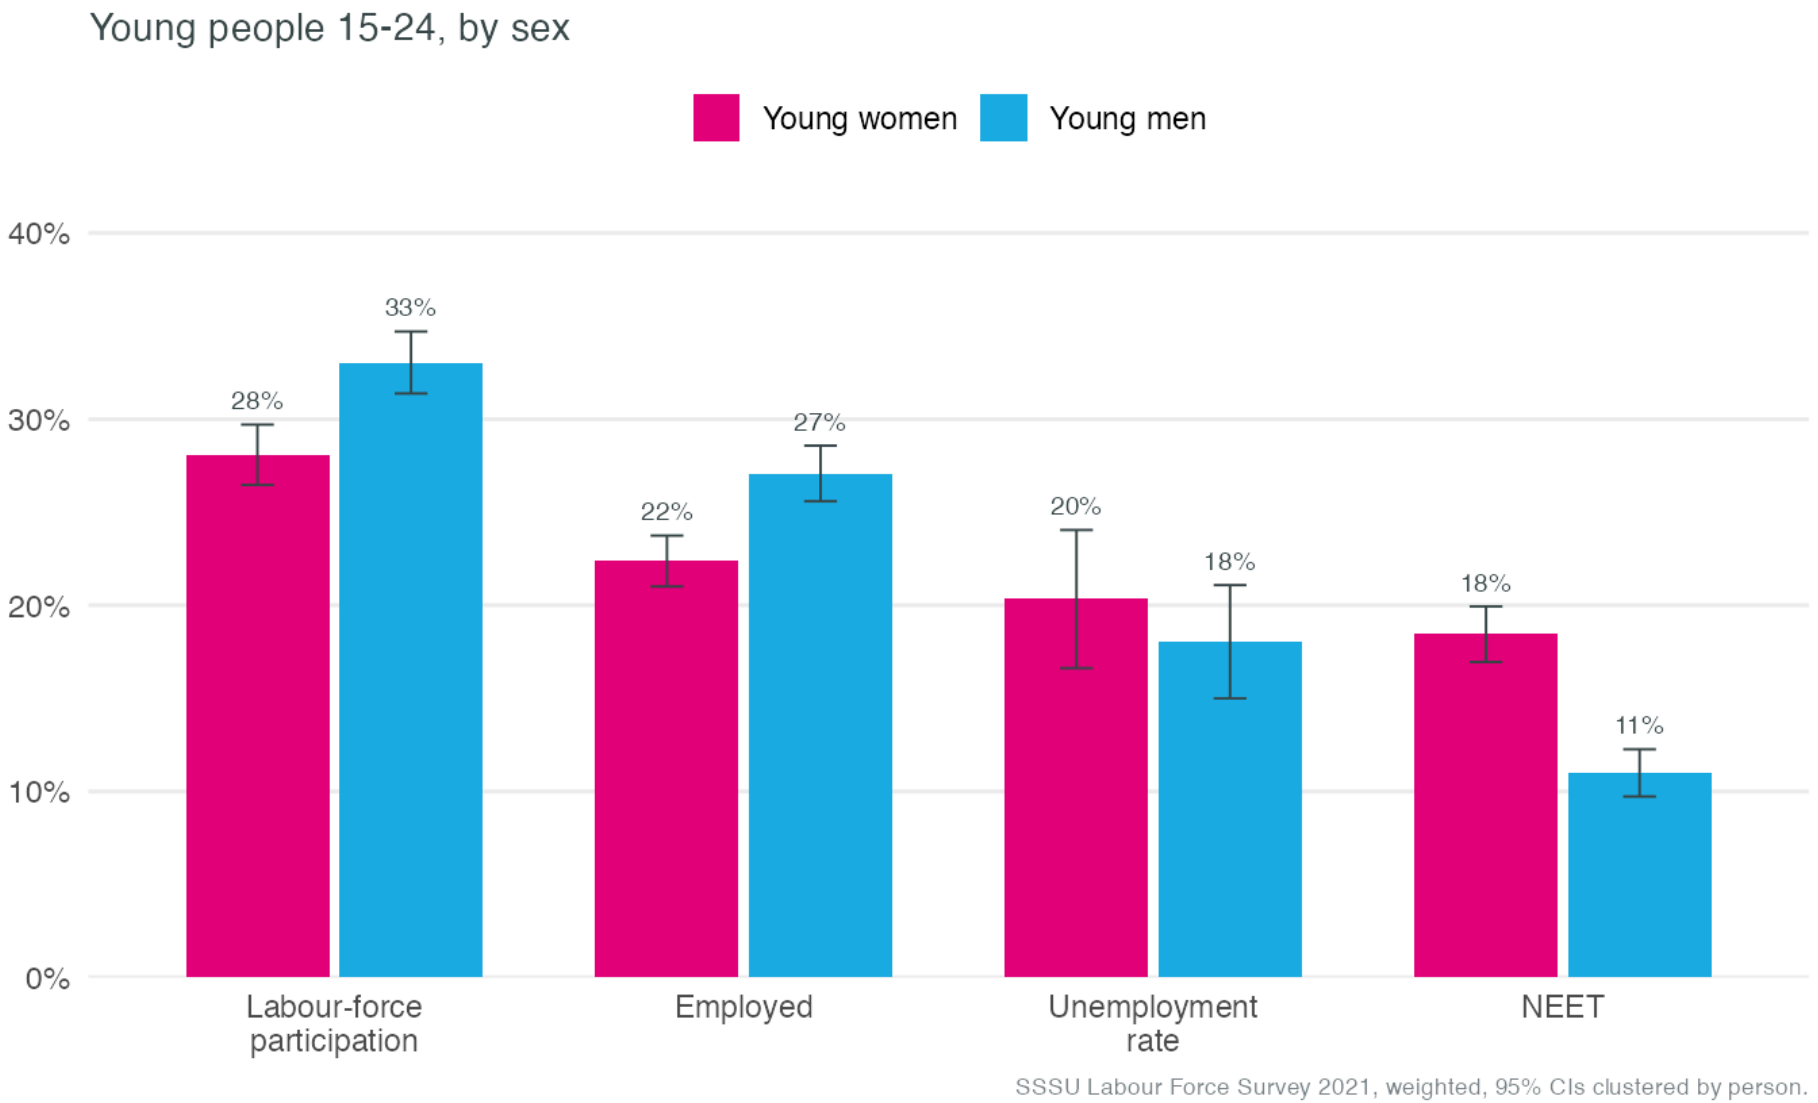

Effects in percentage points. Controls: age 18–24, rural, displacement, disability in household, poorest 40%, lives with own child, partnership and tertiary education (except where interacted), oblast fixed effects.

Returns to education, HSESS 2023/24

Sample	Return per year (%)	95% low	95% high	p	N
Women 19-64	5.8	4.8	6.9	<0.001	3112
Men 19-64	7.2	5.7	8.6	<0.001	2772
Difference women vs men (interaction)	-0.9	NA	NA	0.230	5884

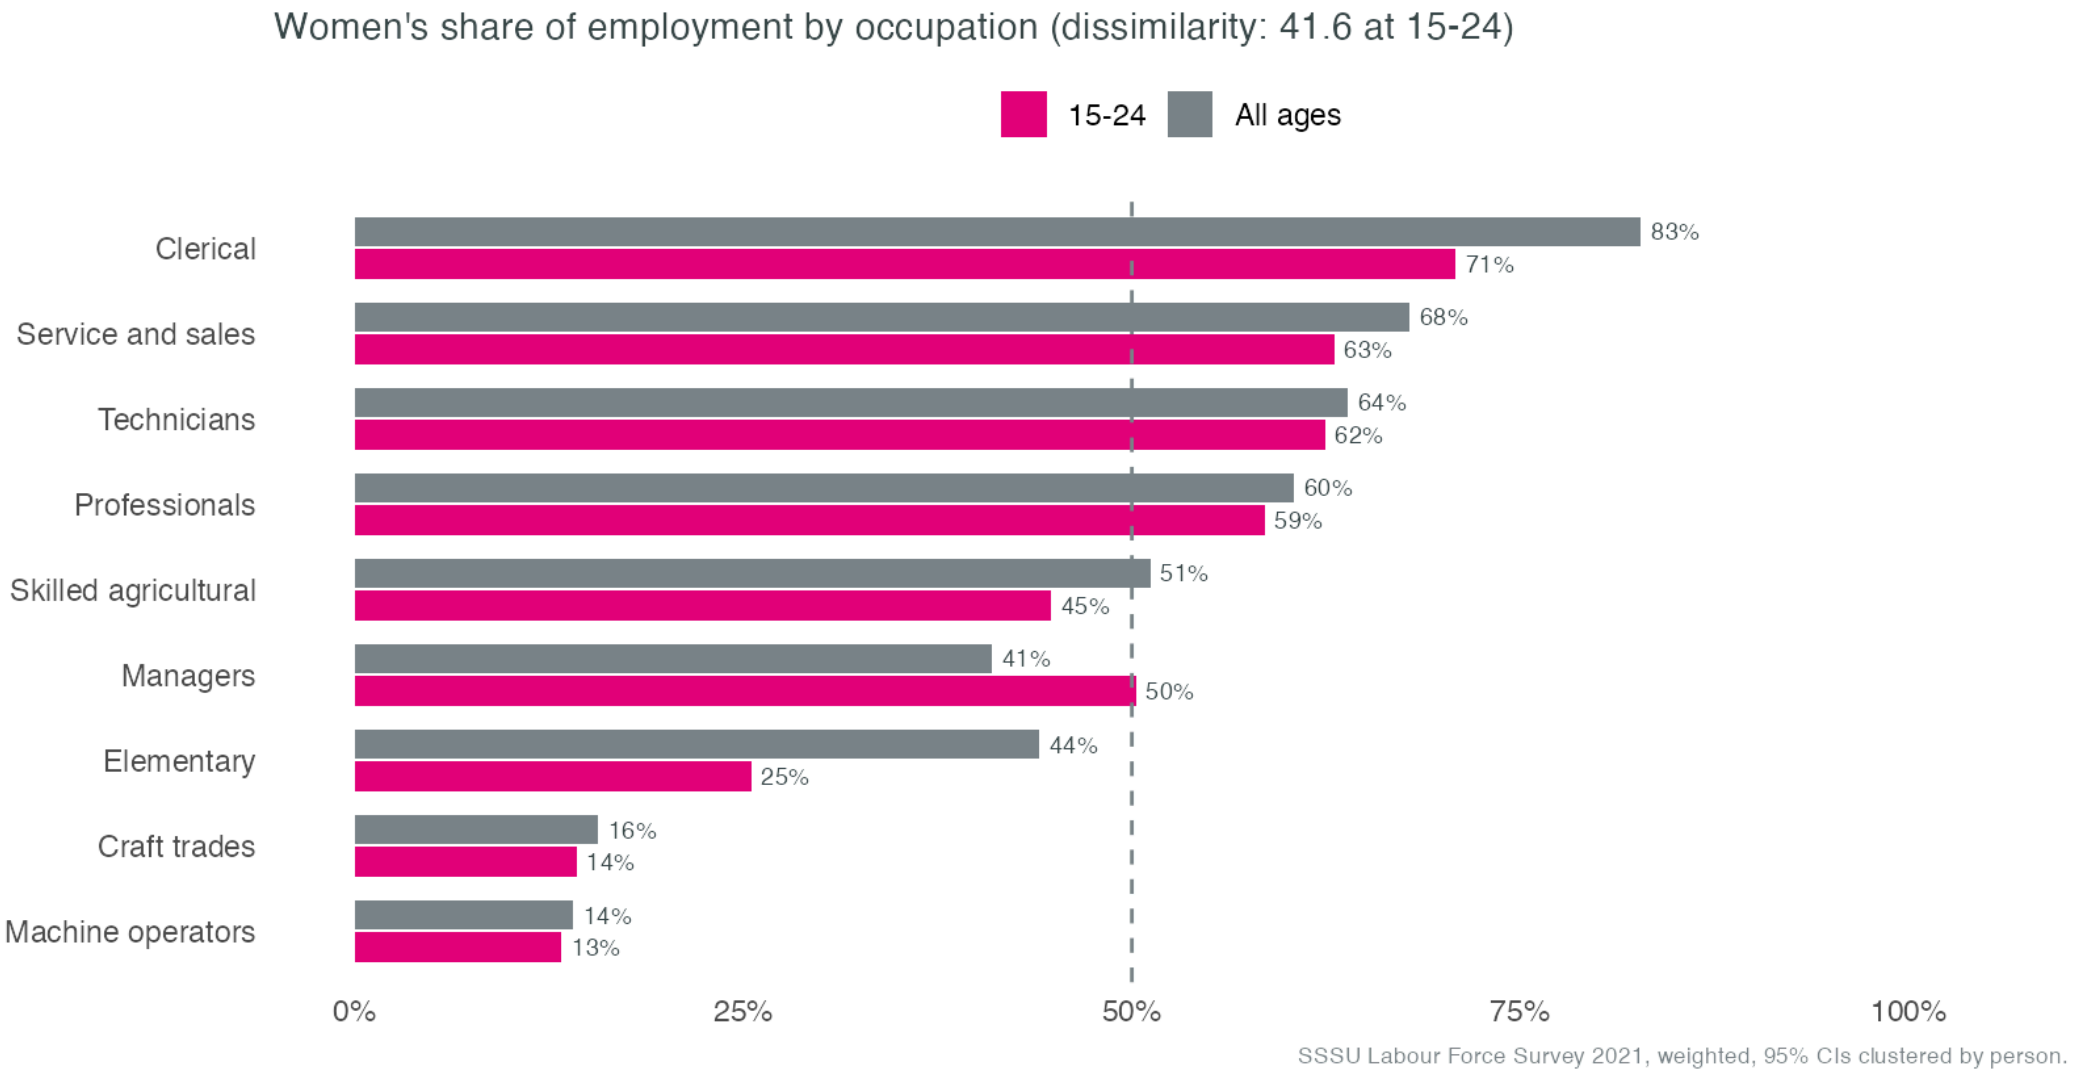

Log monthly net wage on years of education, age and age squared, oblast fixed effects, weighted, standard errors clustered by household. Wage earners aged 19–64.

Labour Force Survey 2021 (reference): NEET at 15–24, 18% for women and 11% for men

SSSU Labour Force Survey 2021, collected in 2021. The public file releases age in bands, so 18–24 cannot be shown separately.

Labour Force Survey 2021 (reference): occupational dissimilarity index 41.6 at 15–24 and 35.2 for all ages
